

DESCRIPTION

POLYHYDROXYALKANOATE HAVING VINYL GROUP, ESTER GROUP,
CARBOXYL GROUP, AND SULFONIC GROUP, AND METHOD OF
5 PRODUCING THE SAME

TECHNICAL FIELD

The present invention relates to a novel
polyhydroxyalkanoate and a method of producing the
10 same.

BACKGROUND ART

In recent years, biodegradable polymer
materials have been finding a wide variety of
15 applications including medical materials, drug
delivery systems, and environmentally compatible
materials. In recent years, in addition to those
applications, the biodegradable polymer materials
have been requested to provide new functions, and
20 hence various studies have been made. In particular,
the introduction of a chemically modifiable
functional group into a molecule of a
polyhydroxyalkanoate typified by polylactic acid has
been examined. For example, there has been reported
25 a compound into which a carboxyl group or a vinyl
group is introduced. For example, polymalic acid has
been known as a polyhydroxyalkanoate having a

carboxyl group at a side chain thereof. An α -type represented by the chemical formula (12) and a β -type represented by the chemical formula (13) have been known as polymers of polymalic acid depending on the form of a polymer.

Of those, a polymer obtained by ring-opening polymerization of a benzyl ester of β -malolactone represented by the chemical formula (14) is disclosed in US 4,265,247 (Patent Document 1) as β -type polymalic acid or a copolymer thereof.

(R₁₄: benzyl group.)

In addition, a polymer obtained by copolymerization of a six-membered ring diester monomer and a glycolide or lactide as a cyclic diester or a lactone

as an intramolecular ring closure reaction ester of ω -hydroxycarboxylic acid represented by the chemical formula (15) is disclosed in Japanese Patent .

Application Laid-Open No. H02-003415 (Patent Document

5 2) as a copolymer containing any one of other hydroxyalkanoic acids typified by α -type polymalic acid-glycolic acid copolymer and glycolic acid.

(15)

(R₁₅ represents a lower alkyl group such as a methyl group, an ethyl group, an n-propyl group, an isopropyl group, or a t-butyl group, or a benzyl group.)

Macromolecules 2000, 33 (13), 4619-4627 (Non-Patent Document 1) discloses that 7-oxo-4-oxepanonecarboxylate is subjected to ring-opening polymerization to produce a polymer having an ester group at a side chain thereof, and the polymer is further subjected to hydrogenolysis to produce a polymer having a carboxylic acid at a side chain thereof as a polyhydroxyalkanoate having a carboxylic acid at a side chain thereof. Biomacromolecules 2000, 1, 275 (Non-Patent Document 2) discloses a polymer in which a benzyloxycarbonyl group is introduced into a methylene group at position α of a carbonyl group in

the main chain of poly(ϵ -caprolactone), the polymer being obtained by: allowing lithium diisopropylamide to react with poly(ϵ -caprolactone); and allowing the resultant to react with benzyl chloroformate.

- 5 Macromolecular Bioscience 2004, 4, 232 (Non-Patent Document 3) discloses a polymer in which a (benzyloxycarbonyl)methyl group is introduced into a methylene group at position α of a carbonyl group in the main chain of polylactic acid, the polymer being
10 obtained by: allowing lithium diisopropylamide to react with polylactic acid; and allowing the resultant to react with benzyl bromoacetate.

- Polymeric Materials Science & Engineering 2002, 87, 254 (Non-Patent Document 4) discloses, as a
15 polyhydroxyalkanoate having a vinyl group at a side chain thereof, a polymer obtained by ring-opening polymerization of α -allyl(δ -valerolactone). Similarly, Polymer Preprints 2002, 43 (2), 727 (Non-Patent Document 5) discloses, as a
20 polyhydroxyalkanoate having a vinyl group at a side chain thereof, a polymer obtained by ring-opening polymerization of 3,6-diallyl-1,4-dioxane-2,5-dione as a six-membered ring diester monomer.

- There has been reported a polymer having a new
25 function into which a structure providing functional properties for a polyhydroxyalkanoate into which a chemically modifiable functional group is introduced

as described above is introduced. International Journal of Biological Macromolecules 25 (1999) 265 (Non-Patent Document 6) discloses the following. A copolymer of α -type malic acid and glycolic acid is
5 obtained by ring-opening polymerization of a cyclic dimer of α -type malic acid and glycolic acid, and the resultant polymer is deprotected to obtain a polyester having a carboxyl group at a side chain thereof. Tripeptide is chemically modified to the
10 carboxyl group at the side chain, and the resultant polymer is evaluated for cell adhesion. At this time, a good result is obtained.

DISCLOSURE OF THE INVENTION

It may be possible that new functional properties can be provided by introducing a unit having a carboxyl group or a vinyl group, which is a reactive functional group, in a molecule as described above; and chemically modifying the reactive functional group. However, there have been a small number of reports concerning it. In view of the above, the present invention provides: a novel polyhydroxyalkanoate having a reactive functional group in a molecule and a method of producing the same; and a novel polyhydroxyalkanoate having a new function obtained by chemically modifying the polyhydroxyalkanoate having a reactive functional group and a method of producing the same.

The inventors of the present invention have made extensive studies with a view to developing a novel polyhydroxyalkanoate having a reactive functional group in a molecule and a novel polyhydroxyalkanoate having a new function obtained by chemically modifying the polyhydroxyalkanoate having a reactive functional group, thereby completing the invention described below.

The polyhydroxyalkanoate according to the present invention includes the following.

- (1) A polyhydroxyalkanoate containing one or more units each represented by the chemical formula (1) in

a molecule.

(In the formula, R represents $-\text{A}_1-\text{SO}_2\text{R}_1$. R_1 represents OH, a halogen atom, ONa, OK, or OR_{1a} . R_{1a} and A_1 each
 5 independently represent a group having a substituted or unsubstituted aliphatic hydrocarbon structure, a substituted or unsubstituted aromatic ring structure, or a substituted or unsubstituted heterocyclic
 structure. In addition, n represents an integer
 10 selected from 1 to 4 and m represents an integer selected from 0 to 8. When multiple units exist, R, R_1 , R_{1a} , A_1 , m, and n each independently have the above meaning for each unit.)

(2) A polyhydroxyalkanoate containing one or more
 15 units each represented by the chemical formula (5).

(In the formula, R_5 represents hydrogen, a group for forming a salt, or R_{5a} . R_{5a} represents a linear or branched alkyl or aralkyl group having 1 to 12 carbon atoms, or a substituent having a saccharide. n represents an integer selected from 1 to 4 and m represents an integer selected from 0 to 8. When $n = 4$, R_5 represents only a substituent having a saccharide for $m = 0$. When multiple units exist, R_5 , R_{5a} , m , and n each independently have the above meaning for each unit.)

(3) A polyhydroxyalkanoate containing one or more units each represented by the chemical formula (6).

(In the formula, n represents an integer selected from 1 to 4. When n represents an integer selected from 1, 2, and 4, m represents an integer selected from 0 to 8. When $n = 3$, m represents an integer selected from 0 and 2 to 8. When multiple units exist, m and n each independently have the above meaning for each unit.)

Meanwhile, the method of producing a polyhydroxyalkanoate according to the present

invention includes the following.

(A) A method of producing a polyhydroxyalkanoate represented by the chemical formula (6), characterized by including polymerizing a compound
 5 represented by the chemical formula (8) in the presence of a catalyst.

(In the formula, n represents an integer selected from 1 to 4. When n represents an integer selected from 1, 2, and 4, m represents an integer selected
 10 from 0 to 8. When n = 3, m represents an integer selected from 0 and 2 to 8.)

(In the formula, n represents an integer selected from 1 to 4. When n represents an integer selected from 1, 2, and 4, m represents an integer selected from 0 to 8. When n = 3, m represents an integer selected from 0 and 2 to 8. When multiple units
 15

exist, m and n each independently have the above meaning for each unit.)

- (B) A method of producing a polyhydroxyalkanoate containing a unit represented by the chemical formula (10), characterized by including subjecting a double bond portion of a polyhydroxyalkanoate containing a unit represented by the chemical formula (9) to an oxidation reaction.

- (In the formula, n represents an integer selected from 1 to 4 and m represents an integer selected from 0 to 8. When multiple units exist, m and n each independently have the above meaning for each unit.)

- (In the formula, R₁₀ represents hydrogen or a group for forming a salt. n represents an integer selected from 1 to 4 and m represents an integer selected from

0 to 8. When multiple units exist, m, n, and R₁₀ each independently have the above meaning for each unit.)

(C) A method of producing a polyhydroxyalkanoate containing a unit represented by the chemical formula
 5 (1), characterized by including subjecting a polyhydroxyalkanoate containing a unit represented by the chemical formula (10) and at least one kind of amine compound represented by the chemical formula (11) to a condensation reaction.

10

(In the formula, R₁₀ represents hydrogen or a group for forming a salt. n represents an integer selected from 1 to 4 and m represents an integer selected from 0 to 8. When multiple units exist, m, n, and R₁₀ each
 15 independently have the above meaning for each unit.)

(In the formula, R₁₁ represents OH, a halogen atom, ONa, OK, or OR_{11a}. R_{11a} and A₃ are each independently selected from groups each having a substituted or
 20 unsubstituted aliphatic hydrocarbon structure, a

substituted or unsubstituted aromatic ring structure,
 or a substituted or unsubstituted heterocyclic
 structure. When multiple units exist, R_{11} , R_{11a} , and
 A_3 each independently have the above meaning for each
 5 unit.)

(In the formula, R represents $-A_1-SO_2R_1$. R_1 represents
 OH , a halogen atom, ONa , OK , or OR_{1a} . R_{1a} and A_1 each
 independently represent a group having a substituted
 10 or unsubstituted aliphatic hydrocarbon structure, a
 substituted or unsubstituted aromatic ring structure,
 or a substituted or unsubstituted heterocyclic
 structure. n represents an integer selected from 1
 to 3 and m represents an integer selected from 0 to 8.
 15 When multiple units exist, R , R_1 , R_{1a} , A_1 , m , and n
 each independently have the above meaning for each
 unit.)

(D) A method of producing a polyhydroxyalkanoate
 containing a unit represented by the chemical formula
 20 (101), characterized by including the steps of:
 allowing a polyhydroxyalkanoate containing a unit
 represented by the chemical formula (99) to react

with a base; and allowing the compound obtained in the foregoing step to react with a compound represented by the chemical formula (100).

- 5 (In the formula, n represents an integer selected from 1 to 4. When multiple units exist, n's each independently have the above meaning for each unit.)

(100)

- (In the formula, m represents an integer selected from 0 to 8. X represents a halogen atom. R₁₀₀ represents a linear or branched alkyl or aralkyl group having 1 to 12 carbon atoms. When n = 4 in the chemical formula (99), m is not equal to 0.)

(101)

(In the formula, n represents an integer selected

from 1 to 4. When n represents an integer selected from 1 to 3, m represents an integer selected from 0 to 8. When n = 4, m represents an integer selected from 1 to 8. R₁₀₁ represents a linear or branched alkyl or aralkyl group having 1 to 12 carbon atoms. When multiple units exist, R₁₀₁, m, and n each independently have the above meaning for each unit.)

(E) A method of producing a polyhydroxyalkanoate containing a unit represented by the chemical formula (102), characterized by including the step of hydrolyzing a polyhydroxyalkanoate containing a unit represented by the chemical formula (101) in the presence of an acid or an alkali, or the step of subjecting the polyhydroxyalkanoate to hydrogenolysis including catalytic reduction.

(101)

(In the formula, n represents an integer selected from 1 to 4. When n represents an integer selected from 1 to 3, m represents an integer selected from 0 to 8. When n = 4, m represents an integer selected from 1 to 8. R₁₀₁ represents a linear or branched alkyl or aralkyl group having 1 to 12 carbon atoms.

15

When multiple units exist, R_{101} , m , and n each independently have the above meaning for each unit.)

(In the formula, R_{102} represents hydrogen or a group
 5 for forming a salt. n represents an integer selected
 from 1 to 4. When n represents an integer selected
 from 1 to 3, m represents an integer selected from 0
 to 8. When $n = 4$, m represents an integer selected
 from 1 to 8. When multiple units exist, R_{102} , m , and
 10 n each independently have the above meaning for each
 unit.)

(F) A method of producing a polyhydroxyalkanoate
 containing a unit represented by the chemical formula
 (104), characterized by including the steps of:
 15 allowing a polyhydroxyalkanoate containing a unit
 represented by the chemical formula (99) to react
 with a base; and allowing the compound obtained in
 the foregoing step to react with a compound
 represented by the chemical formula (103).

20

16

(In the formula, n represents an integer selected from 1 to 4. When multiple units exist, n's each independently have the above meaning for each unit.)

(103)

- 5 (In the formula, R_{103} represents $-A_{103}-SO_2R_{103a}$. R_{103a} represents OH, a halogen atom, ONa, OK, or OR_{103b} . R_{103b} and A_{103} are each independently selected from groups each having a substituted or unsubstituted aliphatic hydrocarbon structure, a substituted or
- 10 unsubstituted aromatic ring structure, or a substituted or unsubstituted heterocyclic structure. When multiple units exist, R_{103} , R_{103a} , R_{103b} , and A_{103} each independently have the above meaning for each unit.)

(104)

15

(In the formula, n represents an integer selected from 1 to 4. R_{104} represents $-A_{104}-SO_2R_{104a}$. R_{104a}

represents OH, a halogen atom, ONa, OK, or OR_{104b}.
 R_{104b} and A₁₀₄ each independently represent a group
 having a substituted or unsubstituted aliphatic
 hydrocarbon structure, a substituted or unsubstituted
 5 aromatic ring structure, or a substituted or
 unsubstituted heterocyclic structure. When multiple
 units exist, R₁₀₄, R_{104a}, R_{104b}, A₁₀₄, and n each
 independently have the above meaning for each unit.)

10 BEST MODE FOR CARRYING OUT THE INVENTION

Hereinafter, the contents of the present
 invention will be described. A polyhydroxyalkanoate
 containing a unit represented by the chemical formula
 (1) as a target in the present invention can be
 15 produced by a reaction between a polyhydroxyalkanoate
 containing a unit represented by the chemical formula
 (10) to be used as a starting material and at least
 one kind of aminosulfonic acid compound represented
 by the chemical formula (11).

20

(In the formula, R₁₀ represents hydrogen or a group
 for forming a salt. n represents an integer selected

from 1 to 4 and m represents an integer selected from 0 to 8. When multiple units exist, m, n, and R₁₀ each independently have the above meaning for each unit.)

5 (In the formula, R₁₁ represents OH, a halogen atom, ONa, OK, or OR_{11a}. R_{11a} and A₃ are each independently selected from a substituted or unsubstituted aliphatic hydrocarbon structure, a substituted or unsubstituted aromatic ring structure, and a
10 substituted or unsubstituted heterocyclic structure (R_{11a} represents a monovalent group having a structure selected from them, and A₃ represents a divalent group having a structure selected from them). When multiple units exist, R₁₁, R_{11a}, and A₃ each
15 independently have the above meaning for each unit.)

More specifically, R₁₁ represents OH, a halogen atom, ONa, OK, or OR_{11a}. R_{11a} represents a linear or branched alkyl group having 1 to 8 carbon atoms, or a substituted or unsubstituted phenyl group.

20 A₃ represents a linear or branched and substituted or unsubstituted alkylene group having 1 to 8 carbon atoms, a substituted or unsubstituted phenylene group, a substituted or unsubstituted naphthalene group, or a substituted or unsubstituted
25 heterocyclic structure containing one or more of N, S,

and O. When A_3 represents a ring structure, an unsubstituted ring may be further condensed. In addition, when multiple units exist, R_{11} , R_{11a} , and A_3 each independently have the above meaning for each
5 unit.

When A_3 represents a linear and substituted or unsubstituted alkylene group, an aminosulfonic acid compound represented by the following chemical formula (16) is exemplified.

10

(In the formula, R_{16} represents OH, a halogen atom, ONa, OK, or OR_{16a} . R_{16a} represents a linear or branched alkyl group having 1 to 8 carbon atoms, or a substituted or unsubstituted phenyl group. A_4
15 represents a linear or branched and substituted or unsubstituted alkylene group having 1 to 8 carbon atoms, which may be substituted by an alkyl group having 1 to 20 carbon atoms, an alkoxy group having 1 to 20 carbon atoms, or the like as a substituent.)

20 Examples of the compound represented by the chemical formula (16) include 2-aminoethanesulfonic acid (taurine), 3-aminopropanesulfonic acid, 4-aminobutanesulfonic acid, 2-amino-2-methylpropanesulfonic acid, and alkali metal salts
25 and esterified products thereof.

When A_3 represents a substituted or unsubstituted phenylene group, an aminosulfonic acid compound represented by the following chemical formula (17) is exemplified.

5

(In the formula, R_{3a} , R_{3b} , R_{3c} , R_{3d} , and R_{3e} each independently represent SO_2R_{3f} (R_{3f} represents OH, a halogen atom, ONa, OK, or OR_{3f1} . (R_{3f1} represents a linear or branched alkyl group having 1 to 8 carbon atoms, or a substituted or unsubstituted phenyl group.)), a hydrogen atom, a halogen atom, an alkyl group having 1 to 20 carbon atoms, an alkoxy group having 1 to 20 carbon atoms, an OH group, an NH_2 group, an NO_2 group, $COOR_{3g}$ (R_{3g} represents an H atom, an Na atom, or a K atom.), an acetamide group, an OPh group, an NPh group, a CF_3 group, a C_2F_5 group, or a C_3F_7 group (Ph represents a phenyl group.), and at least one of these groups represents SO_2R_{3f} . When multiple units exist, R_{3a} , R_{3b} , R_{3c} , R_{3d} , R_{3e} , R_{3f} , R_{3f1} , and R_{3g} each independently have the above meaning for each unit.)

20

A polyhydroxyalkanoate having one or more units each represented by the chemical formula (3) can be

obtained by using a compound represented by the chemical formula (17).

(In the formula, R_{3a} , R_{3b} , R_{3c} , R_{3d} , R_{3e} , n , and m each
 5 have the above meaning.) Examples of the compound represented by the chemical formula (17) include p-aminobenzenesulfonic acid (sulfanilic acid), m-aminobenzenesulfonic acid, o-aminobenzenesulfonic acid, m-toluidine-4-sulfonic acid, sodium o-
 10 toluidine-4-sulfonate, p-toluidine-2-sulfonic acid, 4-methoxyaniline-2-sulfonic acid, o-anisidine-5-sulfonic acid, p-anisidine-3-sulfonic acid, 3-nitroaniline-4-sulfonic acid, sodium 2-nitroaniline-4-sulfonate, sodium 4-nitroaniline-2-sulfonate, 1,5-
 15 dinitroaniline-4-sulfonic acid, 2-aminophenol-4-hydroxy-5-nitrobenzenesulfonic acid, sodium 2,4-dimethylaniline-5-sulfonate, 2,4-dimethylaniline-6-sulfonic acid, 3,4-dimethylaniline-5-sulfonic acid, 4-isopropylaniline-6-sulfonic acid, 4-

trifluoromethylaniline-6-sulfonic acid, 3-carboxy-4-hydroxyaniline-5-sulfonic acid, 4-carboxyaniline-6-sulfonic acid, and alkali metal salts and esterified products thereof.

- 5 When A₃ represents a substituted or unsubstituted naphthalene group, an aminosulfonic acid compound represented by the following chemical formula (18A) or (18B) is exemplified.

- 10 (In the formula, R_{4a}, R_{4b}, R_{4c}, R_{4d}, R_{4e}, R_{4f}, and R_{4g} each independently represent SO₂R_{4o} (R_{4o} represents OH, a halogen atom, ONa, OK, or OR_{4o1}. (R_{4o1} represents a linear or branched alkyl group having 1 to 8 carbon atoms, or a substituted or unsubstituted phenyl group.)), a hydrogen atom, a halogen atom, an alkyl group having 1 to 20 carbon atoms, an alkoxy group having 1 to 20 carbon atoms, an OH group, an NH₂ group, an NO₂ group, COOR_{4p} (R_{4p} represents an H atom, an Na atom, or a K atom.), an acetamide group, an OPh group, an NHPPh group, a CF₃ group, a C₂F₅ group, or a C₃F₇ group (Ph represents a phenyl group.), and at least one of these groups represents SO₂R_{4o}.)

- (In the formula, R_{4h} , R_{4i} , R_{4j} , R_{4k} , R_{4l} , R_{4m} , and R_{4n} each independently represent SO_2R_{4o} (R_{4o} represents OH, a halogen atom, ONa, OK, or OR_{4o1} . (R_{4o1} represents a linear or branched alkyl group having 1 to 8 carbon atoms, or a substituted or unsubstituted phenyl group.)), a hydrogen atom, a halogen atom, an alkyl group having 1 to 20 carbon atoms, an alkoxy group having 1 to 20 carbon atoms, an OH group, an NH_2 group, an NO_2 group, $COOR_{4p}$ (R_{4p} represents an H atom, an Na atom, or a K atom.), an acetamide group, an OPh group, an NHPH group, a CF_3 group, a C_2F_5 group, or a C_3F_7 group (Ph represents a phenyl group.), and at least one of these groups represents SO_2R_{4o} .)
- 15 A polyhydroxyalkanoate having one or more units each represented by the chemical formula (4A) or (4B) in a molecule can be obtained by using a compound represented by the chemical formula (18A) or (18B).

(In the formula, R_{4a} , R_{4b} , R_{4c} , R_{4d} , R_{4e} , R_{4f} , R_{4g} , n , and m each have the above meaning.)

- 5 (In the formula, R_{4h} , R_{4i} , R_{4j} , R_{4k} , R_{4l} , R_{4m} , R_{4n} , m , and n each have the above meaning.) Examples of the compound represented by the chemical formula (18A) or (18B) include: sulfonic acids such as 1-naphthylamine-5-sulfonic acid, 1-naphthylamine-4-sulfonic acid, 1-naphthylamine-8-sulfonic acid, 2-
- 10

naphthylamine-5-sulfonic acid, 1-naphthylamine-6-sulfonic acid, 1-naphthylamine-7-sulfonic acid, 1-naphthylamine-2-ethoxy-6-sulfonic acid, 1-amino-2-naphthol-4-sulfonic acid, 6-amino-1-naphthol-3-sulfonic acid, sodium 1-amino-8-naphthol-2,4-sulfonate, sodium 1-amino-8-naphthol-3,6-sulfonate; and alkali metal salts and esterified products of the sulfonic acids.

When A₃ represents a substituted or unsubstituted heterocyclic structure containing one or more of N, S, and O, A₃ may represent any one of a pyridine ring, a piperazine ring, a furan ring, and a thiol ring as a heterocyclic ring. Examples of such a compound include: sulfonic acids such as 2-aminopyridine-6-sulfonic acid and 2-aminopiperazine-6-sulfonic acid; and alkali metal salts and esterified products of the sulfonic acids.

As described above, examples of a group forming an ester bond with a sulfonic acid in the case of a sulfonate include a substituted or unsubstituted aliphatic hydrocarbon structure, a substituted or unsubstituted aromatic ring structure, and a substituted or unsubstituted heterocyclic structure). Furthermore, a linear or branched alkyl group having 1 to 8 carbon atoms, a substituted or unsubstituted phenyl group, or the like is preferable. From the viewpoint of, for example, ease of esterification,

one having a group such as OCH_3 , OC_2H_5 , OC_6H_5 , OC_3H_7 , OC_4H_9 , $\text{OCH}(\text{CH}_3)_2$, $\text{OCH}_2\text{C}(\text{CH}_3)_3$, or $\text{OC}(\text{CH}_3)_3$ is more preferable.

(Method of producing polyhydroxyalkanoate
5 having unit represented by chemical formula (1))

A reaction between a polyhydroxyalkanoate containing a unit represented by the chemical formula (10) and an aminosulfonic acid compound represented by the chemical formula (11) in the present invention
10 will be described in detail.

The amount of the compound represented by the chemical formula (11) to be used in the present invention is in the range of 0.1 to 50.0 times mole, or preferably 1.0 to 20.0 times mole with respect to
15 the unit represented by the chemical formula (10) to be used as a starting material. An example of a method of producing an amide bond from a carboxylic acid and an amine in the present invention includes a condensation reaction by virtue of heat dehydration.
20 In particular, from the viewpoint of achieving a mild reaction condition under which an ester bond of a polymer main chain is not cleaved, a method is effective, which involves: activating a carboxylic acid portion with an activator to produce an active
25 acyl intermediate; and allowing the intermediate to react with an amine. Examples of the active acyl intermediate include an acid halide, an acid

anhydride, and an active ester. In particular, a method of forming an amide bond in an identical reaction field by using a condensing agent is preferable from the viewpoint of simplifying a production process.

If required, the active acyl intermediate may be isolated as an acid halide before being subjected to a condensation reaction with an amine.

A phosphoric acid-based condensing agent used for polycondensation of an aromatic polyamide, a carbodiimide-based condensing agent used for synthesizing a peptide, an acid chloride-based condensing agent, or the like can be appropriately selected as a condensing agent to be used depending on the combination of the chemical formulae (11) and (10).

Examples of the phosphoric acid-based condensing agent include a phosphite-based condensing agent, a phosphorus chloride-based condensing agent, a phosphoric anhydride-based condensing agent, a phosphate-based condensing agent, and a phosphoric amide-based condensing agent.

A phosphite-based condensing agent or the like can be used in the reaction of the present invention. Examples of a phosphite used at this time include triphenyl phosphite, diphenyl phosphite, tri-*o*-tolyl phosphite, di-*o*-tolyl phosphite, tri-*m*-tolyl

phosphite, di-m-tolyl phosphite, tri-p-tolyl phosphite, di-p-tolyl phosphite, di-o-chlorophenyl phosphite, tri-p-chlorophenyl phosphite, di-p-chlorophenyl phosphite, trimethyl phosphite, and
5 triethyl phosphite. Of those, triphenyl phosphite is preferably used. A metal salt such as lithium chloride or calcium chloride may be added for improving the solubility, reactivity, and the like of a polymer.

10 Examples of the carbodiimide-based condensing agent include dicyclohexyl carbodiimide (DCC), N-ethyl-N'-3-dimethylaminopropyl carbodiimide (EDC=WSCl), and diisopropyl carbodiimide (DIPC). DCC or WSCI may be used in combination with N-
15 hydroxysuccineimide (HONSu), 1-hydroxybenzotriazole (HOBt), 3-hydroxy-4-oxo-3,4-dihydro-1,2,3-benzotriazine (HOOBt), or the like.

The amount of the condensing agent to be used is in the range of 0.1 to 50 times mole, or
20 preferably 1 to 20 times mole with respect to the compound represented by the chemical formula (10).

A solvent may be used as required in the reaction of the present invention. Examples of an available solvent include: hydrocarbons such as
25 hexane, cyclohexane, and heptane; ketones such as acetone and methyl ethyl ketone; ethers such as dimethyl ether, diethyl ether, and tetrahydrofuran;

halogenated hydrocarbons such as dichloromethane, chloroform, carbon tetrachloride, dichloroethane, and trichloroethane; aromatic hydrocarbons such as benzene and toluene; aprotic polar solvents such as
5 N,N-dimethylformamide, dimethyl sulfoxide, dimethyl acetamide, and hexamethylphosphoramide; pyridine derivatives such as pyridine and picoline; and N-methylpyrrolidone. Pyridine, N-methylpyrrolidone, or the like is particularly preferably used. The amount
10 of the solvent to be used can be appropriately determined in accordance with kinds of a starting material and a base, a reaction condition, and the like.

A reaction temperature is not particularly
15 limited in the method of the present invention, but is generally in the range of -20°C to the boiling point of a solvent. However, it is preferable to perform the reaction at an optimum temperature suited for a condensing agent to be used.

20 In the method of the present invention, a reaction time is generally in the range of 1 to 48 hours. The reaction time is particularly preferably in the range of 1 to 10 hours.

A thus produced reaction solution containing a
25 polyhydroxyalkanoate having a unit represented by the chemical formula (1) in the present invention can be collected and purified by, for example, distillation

as an ordinary method. Alternatively, the reaction solution can be collected by: mixing a solvent (for example, water, an alcohol such as methanol or ethanol, or an ether such as dimethyl ether, diethyl ether, or tetrahydrofuran) evenly with the reaction solution; and reprecipitating a target polyhydroxyalkanoate having a unit represented by the chemical formula (1). The resultant polyhydroxyalkanoate having a unit represented by the chemical formula (1) can be subjected to isolation purification as required. A method for the isolation purification is not particularly limited, and a method involving reprecipitation using a solvent insoluble in the polyhydroxyalkanoate represented by the chemical formula (1), a method according to column chromatography, dialysis, or the like can be used.

When an R portion in the chemical formula (1) is $-A_1-SO_3H$, a method can be adopted as another production method of the present invention, which involves methyl esterifying the R portion in the chemical formula (1) into $-A_1-SO_3CH_3$ using a methyl-esterifying agent after a condensation reaction with an amine. Examples of an available methyl-esterifying agent include those used for methyl esterification of an aliphatic acid in gas chromatography. Examples of a methyl esterification

method include: acid catalyst methods such as a hydrochloric acid-methanol method, a boron trifluoride-methanol method, and a sulfuric acid-methanol method; and base catalyst methods such as a sodium methoxide method, a tetramethylguanidine method, and a trimethylsilyldiazomethane method. Of those, a trimethylsilyldiazomethane method is preferable because methylation can be performed under a moderate condition.

10 Examples of a solvent to be used in the reaction of the present invention include: hydrocarbons such as hexane, cyclohexane, and heptane; alcohols such as methanol and ethanol; halogenated hydrocarbons such as dichloromethane, 15 chloroform, carbon tetrachloride, dichloroethane, and trichloroethane; and aromatic hydrocarbons such as benzene and toluene. Halogenated hydrocarbons and the like are particularly preferably used. The amount of the solvent to be used can be appropriately 20 determined in accordance with a starting material, a reaction condition, and the like. A reaction temperature is not particularly limited in the method of the present invention, but is generally in the range of -20°C to 30°C. However, it is preferable to 25 perform the reaction at an optimum temperature suited for a condensing agent and a reagent to be used.

In addition, a polyhydroxyalkanoate having a

unit represented by the chemical formula (104)
 included in the chemical formula (1) of the present
 invention can be produced through the steps of:
 allowing a polyhydroxyalkanoate having a unit
 5 represented by the chemical formula (99) as a
 starting material to react with a base; and allowing
 the compound obtained in the foregoing step to react
 with a compound represented by the chemical formula
 (103).

10

(In the formula, n represents an integer selected
 from 1 to 4. R_{104} represents $-A_{104}-SO_2R_{104a}$. R_{104a}
 represents OH, a halogen atom, ONa, OK, or OR_{104b} .
 R_{104b} and A_{104} each independently represent a
 15 substituted or unsubstituted aliphatic hydrocarbon
 structure, a substituted or unsubstituted aromatic
 ring structure, or a substituted or unsubstituted
 heterocyclic structure. When multiple units exist,
 R_{104} , R_{104a} , R_{104b} , A_{104} , and n each independently have
 20 the above meaning for each unit.)

(99)

(In the formula, n represents an integer selected from 1 to 4. When multiple units exist, n's each independently have the above meaning for each unit.)

(103)

5

- (In the formula, R_{103} represents $-A_{103}-SO_2R_{103a}$. R_{103a} represents OH, a halogen atom, ONa, OK, or OR_{103b} . R_{103b} and A_{103} are each independently selected from a substituted or unsubstituted aliphatic hydrocarbon structure, a substituted or unsubstituted aromatic ring structure, and a substituted or unsubstituted heterocyclic structure. When multiple units exist, R_{103} , R_{103a} , R_{103b} , and A_{103} each independently have the above meaning for each unit.)
- 10 Examples of the compound represented by the chemical formula (103) include 2-acrylamide-2-methylpropanesulfonic acid, and alkali metal salts and esterified products thereof.
- 15

A reaction between the polyhydroxyalkanoate
20 containing a unit represented by the chemical formula

(99) and the compound represented by the chemical formula (103) in the present invention will be described in detail.

The present invention can be achieved by
5 subjecting an α -methylene group adjacent to a
carbonyl group in a polymer main chain to a Michael
addition reaction with the compound represented by
the chemical formula (103). To be specific, the
present invention can be achieved by: allowing the
10 polyhydroxyalkanoate containing a unit represented by
the chemical formula (99) to react with a base
capable of forming into an action an α -methylene
group which is adjacent to a carbonyl group in the
polymer main chain of the polyhydroxyalkanoate
15 containing a unit represented by the chemical formula
(99) under a Michael addition reaction condition; and
allowing the resultant to react with the compound
represented by the chemical formula (103). In the
present invention, the amount of the compound
20 represented by the chemical formula (103) to be used
is 0.001 to 100 times mole, or preferably 0.01 to 10
times mole with respect to the unit represented by
the chemical formula (99).

A solvent to be used in the reaction of the
25 present invention is not particularly limited as long
as it is inactive to the reaction and dissolves the
starting material to some extent. Examples of such a

solvent include: aliphatic hydrocarbons such as hexane, cyclohexane, heptane, ligroin, and petroleum ether; aromatic hydrocarbons such as benzene, toluene, and xylene; ethers such as diethyl ether, diisopropyl ether, tetrahydrofuran, dioxane, dimethoxyethane, and diethyleneglycoldimethylether; and amides such as formamide, N,N-dimethylformamide, N,N-dimethylacetamide, N-methyl-2-pyrrolidone, N-methylpyrrolidinone, and hexamethylphosphortriamide. .

10 Of those, tetrahydrofuran is preferable.

The reaction is performed in the presence of a base. Examples of a base to be used include: lithium alkyls such as methyl lithium and butyl lithium; alkali metal disilazides such as lithium hexamethyl disilazide, sodium hexamethyl disilazide, and potassium hexamethyl disilazide; and lithium amides such as lithium diisopropylamide and lithium dicyclohexylamide. Of those, lithium diisopropylamide is preferable. In addition, the

15 amount of the base to be used is 0.001 to 100 times mole, or preferably 0.01 to 10 times mole with respect to the unit represented by the chemical formula (99).

In the method of the present invention, a reaction temperature is generally in the range of -78°C to 40°C, or preferably in the range of -78°C to 30°C.

25

In the method of the present invention, a reaction time is generally in the range of 10 minutes to 24 hours. The reaction time is particularly preferably in the range of 10 minutes to 4 hours.

5 In the polyhydroxyalkanoate having a unit represented by the chemical formula (5) of the present invention, the polyhydroxyalkanoate having a unit represented by the chemical formula (10A) can be produced by oxidizing a side chain double bond
 10 portion of a polyhydroxyalkanoate having a unit represented by the chemical formula (9A) as a starting material.

(In the formula, R_{10A} represents hydrogen or a group for forming a salt. n represents an integer selected
 15 from 1 to 4. When n represents an integer selected from 1 to 3, m represents an integer selected from 0 to 8. When $n = 4$, m represents an integer selected from 1 to 8. When multiple units exist, m , n , and
 20 R_{10A} each independently have the above meaning for each unit.)

(9 A)

(In the formula, n represents an integer selected from 1 to 4. When n represents an integer selected from 1 to 3, m represents an integer selected from 0 to 8. When n = 4, m represents an integer selected from 1 to 8. When multiple units exist, m and n each independently have the above meaning for each unit.)

Known examples of a method of obtaining a carboxylic acid by subjecting such a carbon-carbon double bond as described above to oxidation cleavage by means of an oxidizing agent include a method involving the use of a permanganate (J. Chem. Soc., Perkin. Trans. 1, 806 (1973)), a method involving the use of a dichromate (Org. Synth., 4, 698 (1963)), a method involving the use of a periodate (J. Org. Chem., 46, 19 (1981)), a method involving the use of nitric acid (Japanese Patent Application Laid-open No. S59-190945), and a method involving the use of ozone (J. Am. Chem. Soc., 81, 4273 (1959)). In addition, Macromolecular chemistry, 4, 289-293 (2001) has reported a method of obtaining a carboxylic acid involving subjecting a carbon-carbon double bond of a side chain terminal of a polyhydroxyalkanoate

produced by using an organism to a reaction under an acid condition by means of potassium permanganate as an oxidizing agent. A similar method can be used in the present invention.

5 Potassium permanganate is generally used as a permanganate to be used as an oxidizing agent. The amount of the permanganate to be used is generally 1 mole equivalent or more, or preferably 2 to 10 mole equivalents with respect to 1 mole of the unit
10 represented by the chemical formula (9A) because an oxidation cleavage reaction is a stoichiometric reaction.

Various inorganic acids such as sulfuric acid, hydrochloric acid, acetic acid, and nitric acid, and
15 organic acids are generally used to place a reaction system under an acid condition. However, the use of an acid such as sulfuric acid, nitric acid, or hydrochloric acid may cause a molecular weight to reduce because an ester bond of a main chain is
20 cleaved. Therefore, acetic acid is preferably used. The amount of an acid to be used is generally in the range of 0.2 to 2,000 mole equivalents, or preferably in the range of 0.4 to 1,000 mole equivalents with respect to 1 mole of the unit represented by the
25 chemical formula (9A). An amount of 0.2 mole equivalent or more is preferable because a high yield is achieved. An amount of 2,000 mole equivalents or

less is preferable because the amount of a decomposed product due to the acid produced as a by-product can be reduced. Therefore, the amount of an acid is preferably used within the above-described range. In addition, a crown-ether can be used for the purpose of accelerating the reaction. In this case, the crown-ether and the permanganate form a complex, thereby providing an enhancing effect on reaction activity. Dibenzo-18-crown-6-ether, dicyclo-18-crown-6-ether, or 18-crown-6-ether is generally used as the crown-ether. The amount of the crown-ether to be used is generally in the range of 0.005 to 2.0 mole equivalents, or preferably in the range of 0.01 to 1.5 mole equivalents with respect to 1 mole of the permanganate.

A solvent to be used in an oxidation reaction is not particularly limited as long as it is inactive to the reaction. Examples of such a solvent include: water; acetone; ethers such tetrahydrofuran and dioxane; aromatic hydrocarbons such as benzene; aliphatic hydrocarbons such as hexane and heptane; and halogenated hydrocarbons such as methyl chloride, dichloromethane, and chloroform. Of those solvents, halogenated hydrocarbons such as methyl chloride, dichloromethane, and chloroform, and acetone are preferable in consideration of the solubility of the polyhydroxyalkanoate.

In the oxidation reaction of the present invention, the polyhydroxyalkanoate containing a unit represented by the chemical formula (9A), the permanganate, and the acid may be collectively charged together with a solvent at the first stage to carry out a reaction, or each of them may be continuously or intermittently added to a system to carry out a reaction. Alternatively, only the permanganate may be dissolved or suspended into the solvent in advance, and subsequently the polyhydroxyalkanoate and the acid may be continuously or intermittently added to the system to carry out a reaction. Alternatively, only the polyhydroxyalkanoate may be dissolved or suspended into the solvent in advance, and subsequently the permanganate and the acid may be continuously or intermittently added to the system to carry out a reaction. Furthermore, the polyhydroxyalkanoate and the acid may be charged in advance, and subsequently the permanganate may be continuously or intermittently added to the system to carry out a reaction. Alternatively, the permanganate and the acid may be charged in advance, and subsequently the polyhydroxyalkanoate may be continuously or intermittently added to the system to carry out a reaction. Alternatively, the polyhydroxyalkanoate and the permanganate may be charged in advance, and

subsequently the acid may be continuously or intermittently added to the system to carry out a reaction.

A reaction temperature is generally in the range of -40°C to 40°C , or preferably in the range of -10°C to 30°C . A reaction time, which depends on the stoichiometric mixture ratio between the unit represented by the chemical formula (9A) and the permanganate and the reaction temperature, is generally in the range of 2 to 48 hours.

It should be noted that a polyhydroxyalkanoate containing a unit represented by the chemical formula (10B) shown in the present invention can be produced from a polyhydroxyalkanoate containing a unit represented by the chemical formula (9B) by means of a method similar to the oxidation reaction described above. This method is a novel production method.

(In the formula, $\text{R}_{10\text{B}}$ represents hydrogen or a group for forming a salt. n represents 4 and m represents 0.)

(In the formula, n represents 4 and m represents 0.)

In addition, in the polyhydroxyalkanoate having a unit represented by the chemical formula (5), the polyhydroxyalkanoate having a unit represented by the chemical formula (102) can be produced by hydrolyzing a side chain ester portion of a polyhydroxyalkanoate having a unit represented by the chemical formula (101) as a starting material in the presence of an acid or an alkali, or by subjecting the polyhydroxyalkanoate to hydrogenolysis including catalytic reduction.

(In the formula, R₁₀₂ represents hydrogen or a group for forming a salt. n represents an integer selected from 1 to 4. When n represents an integer selected from 1 to 3, m represents an integer selected from 0 to 8. When n = 4, m represents an integer selected from 1 to 8. When multiple units exist, R₁₀₂, m, and

n each independently have the above meaning for each unit.)

(101)

(In the formula, n represents an integer selected from 1 to 4. When n represents an integer selected from 1 to 3, m represents an integer selected from 0 to 8. When n = 4, m represents an integer selected from 1 to 8. R₁₀₁ represents a linear or branched alkyl or aralkyl group having 1 to 12 carbon atoms.

When multiple units exist, R₁₀₁, m, and n each independently have the above meaning for each unit.)

In the case where hydrolysis in the presence of an acid or an alkali is employed, the hydrolysis can be performed by using, in an aqueous solution or a hydrophilic organic solvent such as methanol, ethanol, tetrahydrofuran, dioxane, dimethylformamide, or dimethyl sulfoxide as a solvent, an aqueous solution of an inorganic acid such as hydrochloric acid, sulfuric acid, nitric acid, or phosphoric acid, an organic acid such as trifluoroacetic acid, trichloroacetic acid, p-toluenesulfonic acid, or methanesulfonic acid, an aqueous caustic alkali such

as sodium hydroxide or potassium hydroxide, an aqueous solution of an alkali carbonate such as sodium carbonate or potassium carbonate, or an alcohol solution of a metal alkoxide such as sodium methoxide or sodium ethoxide. A reaction temperature is generally in the range of 0°C to 40°C, or preferably in the range of 0°C to 30°C. A reaction time is generally in the range of 0.5 to 48 hours. When hydrolysis is performed in the presence of an acid or an alkali, in each case, an ester bond of a main chain is cleaved, and a reduction in molecular weight is observed in some cases.

A method of obtaining a carboxylic acid by way of hydrogenolysis including catalytic reduction is performed as follows. That is, in an appropriate solvent, in the temperature range of -20°C to the boiling point of the solvent used, or preferably 0 to 50°C, in the presence of a reduction catalyst, hydrogen is allowed to act under normal or increased pressure to perform catalytic reduction. Examples of the solvent used include water, methanol, ethanol, propanol, hexafluoroisopropanol, ethyl acetate, diethyl ether, tetrahydrofuran, dioxane, benzene, toluene, dimethylformamide, pyridine, and N-methylpyrrolidone. A mixed solvent of the above solvents may also be used. A catalyst such as palladium, platinum, or rhodium which is used singly

or used while being carried by a carrier, Raney nickel, or the like is used as the reduction catalyst. A reaction time is generally in the range of 0.5 to 72 hours. A thus produced reaction solution

5 containing a polyhydroxyalkanoate having a unit represented by the chemical formula (102) is collected as a crude polymer by: removing the catalyst through filtration; and removing the solvent through distillation or the like. The resultant

10 polyhydroxyalkanoate having a unit represented by the chemical formula (102) can be subjected to isolation purification as required. A method for the isolation purification is not particularly limited, and a method involving reprecipitation using a solvent

15 insoluble in the polyhydroxyalkanoate having a unit represented by the chemical formula (102), a method according to column chromatography, dialysis, or the like can be used. Provided, however, that even in the case where catalytic reduction is employed, an

20 ester bond of a main chain is cleaved, and a reduction in molecular weight is observed in some cases.

In addition, in the polyhydroxyalkanoate having a unit represented by the chemical formula (5) of the

25 present invention, a polyhydroxyalkanoate having a unit represented by the chemical formula (19) can be produced by esterifying a polyhydroxyalkanoate

represented by the chemical formula (10) as a starting material by means of an esterifying agent.

(In the formula, R_{19} represents a linear or branched
 5 alkyl or aralkyl group having 1 to 12 carbon atoms,
 or a substituent having a saccharide. n represents
 an integer selected from 1 to 4 and m represents an
 integer selected from 0 to 8. When $n = 4$, R_{19}
 represents only a substituent having a saccharide for
 10 $m = 0$. When multiple units exist, m , n , and R_{19} each
 independently have the above meaning for each unit.)

(In the formula, R_{10} represents hydrogen or a group
 for forming a salt. n represents an integer selected
 15 from 1 to 4 and m represents an integer selected from
 0 to 8. When multiple units exist, m , n , and R_{10} each
 independently have the above meaning for each unit.)

Examples of the esterifying agent to be used
 include diazomethane and DMF dimethylacetals. For

example, the polyhydroxyalkanoate having a unit represented by the chemical formula (10) easily reacts with trimethylsilyldiazomethane, DMF dimethylacetal, DMF diethylacetal, DMF dipropylacetal, 5 DMF diisopropylacetal, DMF-n-butylacetal, DMF-tert-butylacetal, DMF dineopentylacetal, or the like to produce a corresponding ester. Furthermore, the polyhydroxyalkanoate is allowed to react with any one of alcohols such as methanol, ethanol, propanol, 10 isopropyl alcohol, butyl alcohol, sec-butyl alcohol, tert-butyl alcohol, pentyl alcohol, neopentyl alcohol, hexyl alcohol, heptyl alcohol, octyl alcohol, nonyl alcohol, decyl alcohol, and lauryl alcohol, or any one of saccharides for introducing a sugar structure 15 such as D-glucose, D-fructose, and otherwise by using an acid catalyst or a condensing agent such as DCC to produce an esterified polyhydroxyalkanoate.

In addition, a polyhydroxyalkanoate having a unit represented by the chemical formula (101) 20 included in the chemical formula (5) can be produced through the steps of: allowing a polyhydroxyalkanoate having a unit represented by the chemical formula (99) as a starting material to react with a base; and allowing the compound obtained in the foregoing step 25 to react with a compound represented by the chemical formula (100).

48

Examples of the compound represented by the
5 chemical formula (100) include methyl chloroformate, ethyl chloroformate, propyl chloroformate, isopropyl chloroformate, butyl chloroformate, cyclohexyl chloroformate, benzyl chloroformate, methyl bromoformate, ethyl bromoformate, propyl bromoformate,
10 isopropyl bromoformate, butyl bromoformate, cyclohexyl bromoformate, benzyl bromoformate, methyl chloroacetate, ethyl chloroacetate, propyl chloroacetate, isopropyl chloroacetate, butyl chloroacetate, cyclohexyl chloroacetate, benzyl
15 chloroacetate, methyl bromoacetate, ethyl bromoacetate, propyl bromoacetate, isopropyl bromoacetate, butyl bromoacetate, cyclohexyl bromoacetate, benzyl bromoacetate, methyl 3-chloropropionate, ethyl 3-chloropropionate, propyl 3-chloropropionate, isopropyl 3-chloropropionate, butyl
20 3-chloropropionate, cyclohexyl 3-chloropropionate, benzyl 3-chloropropionate, methyl 3-bromopropionate, ethyl 3-bromopropionate, propyl 3-bromopropionate, isopropyl 3-bromopropionate, butyl 3-bromopropionate, cyclohexyl 3-bromopropionate, benzyl 3-bromopropionate, methyl 4-chlorobutyrate, ethyl 4-chlorobutyrate, propyl 4-chlorobutyrate, isopropyl 4-

chlorobutyrate, butyl 4-chlorobutyrate, cyclohexyl 4-chlorobutyrate, benzyl 4-chlorobutyrate, methyl 4-bromobutyrate, ethyl 4-bromobutyrate, propyl 4-bromobutyrate, isopropyl 4-bromobutyrate, butyl 4-bromobutyrate, cyclohexyl 4-bromobutyrate, benzyl 4-bromobutyrate, methyl 5-chlorovalerate, ethyl 5-chlorovalerate, propyl 5-chlorovalerate, isopropyl 5-chlorovalerate, butyl 5-chlorovalerate, cyclohexyl 5-chlorovalerate, benzyl 5-chlorovalerate, methyl 5-bromovalerate, ethyl 5-bromovalerate, propyl 5-bromovalerate, isopropyl 5-bromovalerate, butyl 5-bromovalerate, cyclohexyl 5-bromovalerate, benzyl 5-bromovalerate, methyl 6-chlorohexanoate, ethyl 6-chlorohexanoate, propyl 6-chlorohexanoate, isopropyl 6-chlorohexanoate, butyl 6-chlorohexanoate, cyclohexyl 6-chlorohexanoate, benzyl 6-chlorohexanoate, methyl 6-bromohexanoate, ethyl 6-bromohexanoate, propyl 6-bromohexanoate, isopropyl 6-bromohexanoate, butyl 6-bromohexanoate, cyclohexyl 6-bromohexanoate, benzyl 6-bromohexanoate, methyl 7-chloroheptanoate, ethyl 7-chloroheptanoate, propyl 7-chloroheptanoate, isopropyl 7-chloroheptanoate, butyl 7-chloroheptanoate, cyclohexyl 7-chloroheptanoate, benzyl 7-chloroheptanoate, methyl 7-bromoheptanoate, ethyl 7-bromoheptanoate, propyl 7-bromoheptanoate, isopropyl 7-bromoheptanoate, butyl 7-bromoheptanoate, cyclohexyl 7-bromoheptanoate, benzyl 7-bromoheptanoate,

methyl 8-chlorooctanoate, ethyl 8-chlorooctanoate, propyl 8-chlorooctanoate, isopropyl 8-chlorooctanoate, butyl 8-chlorooctanoate, cyclohexyl 8-chlorooctanoate, benzyl 8-chlorooctanoate, methyl 8-bromooctanoate, ethyl 8-bromooctanoate, propyl 8-bromooctanoate, isopropyl 8-bromooctanoate, butyl 8-bromooctanoate, cyclohexyl 8-bromooctanoate, benzyl 8-bromooctanoate, methyl 9-chlorononanoate, ethyl 9-chlorononanoate, propyl 9-chlorononanoate, isopropyl 9-chlorononanoate, butyl 9-bromononanoate, cyclohexyl 9-chlorononanoate, benzyl 9-chlorononanoate, methyl 9-bromononanoate, ethyl 9-bromononanoate, propyl 9-bromononanoate, isopropyl 9-bromononanoate, butyl 9-bromononanoate, cyclohexyl 9-bromononanoate, and benzyl 9-bromononanoate.

A reaction between the polyhydroxyalkanoate containing a unit represented by the chemical formula (99) and the compound represented by the chemical formula (100) in the present invention will be described in detail.

The present invention can be achieved by subjecting an α -methylene group adjacent to a carbonyl group in a polymer main chain to an addition reaction with the compound represented by the chemical formula (100). To be specific, the present invention can be achieved by: allowing the polyhydroxyalkanoate containing a unit represented by

the chemical formula (99) to react with a base capable of forming into an action an α -methylene group which is adjacent to a carbonyl group in the polymer main chain of the polyhydroxyalkanoate

5 containing a unit represented by the chemical formula (99) under an addition reaction condition; and allowing the resultant to react with the compound represented by the chemical formula (100). In the present invention, the amount of the compound

10 represented by the chemical formula (100) to be used is 0.001 to 100 times mole, or preferably 0.01 to 10 times mole with respect to the unit represented by the chemical formula (99).

A solvent to be used in the reaction of the

15 present invention is not particularly limited as long as it is inactive to the reaction and dissolves the starting material to some extent. Examples of such a solvent include: aliphatic hydrocarbons such as hexane, cyclohexane, heptane, ligroin, and petroleum

20 ether; aromatic hydrocarbons such as benzene, toluene, and xylene; ethers such as diethyl ether, diisopropyl ether, tetrahydrofuran, dioxane, dimethoxyethane, and diethyleneglycoldimethylether; and amides such as formamide, N,N-dimethylformamide, N,N-

25 dimethylacetamide, N-methyl-2-pyrrolidone, N-methylpyrrolidinone, and hexamethylphosphoramide. Of those, tetrahydrofuran is preferable.

The reaction is performed in the presence of a base. Examples of a base to be used include: lithium alkyls such as methyl lithium and butyl lithium; alkali metal disilazides such as lithium hexamethyl
5 disilazide, sodium hexamethyl disilazide, and potassium hexamethyl disilazide; and lithium amides such as lithium diisopropylamide and lithium dicyclohexylamide. Of those, lithium diisopropylamide is preferable. In addition, the
10 amount of the base to be used in the present invention is 0.001 to 100 times mole, or preferably 0.01 to 10 times mole with respect to the unit represented by the chemical formula (99).

In the method of the present invention, a
15 reaction temperature is generally in the range of -78°C to 40°C , or preferably in the range of -78°C to 30°C .

In the method of the present invention, a reaction time is generally in the range of 10 minutes
20 to 24 hours. The reaction time is particularly preferably in the range of 10 minutes to 4 hours.

The polyhydroxyalkanoate having a unit represented by the chemical formula (101) included in the chemical formula (5) can be produced according to
25 the above production method.

(Method of producing polyhydroxyalkanoate having unit represented by chemical formula (6) from

intramolecular ring-closed compound of ω -hydroxycarboxylic acid)

A polyhydroxyalkanoate having a unit represented by the chemical formula (6) of the present invention can be produced by polymerizing an intramolecular ring-closed compound of ω -hydroxycarboxylic acid represented by the chemical formula (8) in the presence of a catalyst.

(In the formula, n represents an integer selected from 1 to 4. When n represents an integer selected from 1, 2, and 4, m represents an integer selected from 0 to 8. When $n = 3$, m represents an integer selected from 0 and 2 to 8. When multiple units exist, m and n each independently have the above meaning for each unit.)

(In the formula, n represents an integer selected from 1 to 4. When n represents an integer selected

from 1, 2, and 4, m represents an integer selected from 0 to 8. When $n = 3$, m represents an integer selected from 0 and 2 to 8.)

In the production of a polyester containing a unit represented by the chemical formula (6) using an intramolecular ring-closed compound of ω -hydroxycarboxylic acid represented by the chemical formula (8) of the present invention, a polymerization method is not particularly limited, and solution polymerization, slurry polymerization, mass polymerization, or the like can be adopted. In the case where solution polymerization is adopted, a solvent to be used is not particularly limited, and an inert solvent such as an aliphatic hydrocarbon or cyclic hydrocarbon having 5 to 18 carbon atoms or an aromatic hydrocarbon having 6 to 20 carbon atoms, tetrahydrofuran, chloroform, o-dichlorobenzene, dioxane, or the like can be used. Any one of conventionally known ring-opening polymerization catalysts can be used as a catalyst to be used for polymerization. Examples thereof include stannous chloride, stannic chloride, stannous fluoride, stannous acetate, stannous stearate, stannous octanoate, stannous oxide, stannic oxide, and other tin salts. The examples further include triethoxyaluminum, tri-n-propoxy-aluminum, tri-isopropoxyaluminum, tri-n-butoxyaluminum, tri-iso-

butoxyaluminum, aluminum chloride, di-iso-propylzinc, dimethylzinc, diethylzinc, zinc chloride, tetra-n-propoxytitanium, tetra-n-butoxytitanium, tetra-n-butoxytitanium, tetra-t-butoxytitanium, antimony
5 trifluoride, lead oxide, lead stearate, titanium tetrachloride, boron trifluoride, a boron trifluoride ether complex, triethylamine, and tributylamine.

The amount of any one of those catalysts to be used is in the range of 0.0001 to 10 weight%, or
10 preferably 0.001 to 5 weight% with respect to the total amount of a monomer compound.

In the present invention, at the time of ring-opening polymerization, any one of conventionally known polymerization initiators can be used as a
15 polymerization initiator. To be specific, an aliphatic alcohol is used, which may be a monoalcohol, a dialcohol, or a polyalcohol, and may be saturated or unsaturated. Specific examples thereof include: monoalcohols such as methanol, ethanol, propanol,
20 butanol, pentanol, hexanol, heptanol, nonanol, decanol, lauryl alcohol, 1-tetradecanol, cetyl alcohol, stearyl alcohol, and p-tert-butylbenzyl alcohol; dialcohols such as ethylene glycol, butanediol, hexanediol, nonanediol, and
25 tetramethylene glycol; polyalcohols such as glycerol, sorbitol, xylitol, ribitol, and erythritol; methyl lactate; and ethyl lactate. Any one of those

aliphatic alcohols is generally used in an amount of 0.01 to 10 weight% with respect to the total amount of a monomer, although the amount slightly varies depending on conditions such as the kind of an
5 alcohol to be used. In the present invention, a ring-opening polymerization reaction temperature is in the range of 25 to 200°C, preferably 50 to 200°C, or more preferably 100 to 180°C.

In the present invention, a ring-opening
10 polymerization reaction may be performed under an inert gas (such as nitrogen or argon) atmosphere, or may be performed under reduced or increased pressure. At that time, a catalyst and an alcohol may be added sequentially.

15 The polyhydroxyalkanoate according to the present invention, which is mainly constituted by a unit represented by the chemical formula (1), (5), or (6) already shown, may be a copolymer obtained by copolymerization with a second component or the like
20 in order to change physical properties such as mechanical properties and decomposition properties in a wide range. For example, a unit represented by the chemical formula (7) may be further incorporated into a molecule.

(In the formula, R₇ represents a linear or branched alkylene group having 1 to 11 carbon atoms, an alkyleneoxyalkylene group (alkylene groups each
5 independently have 1 or 2 carbon atoms), or an alkylidene group having 1 to 5 carbon atoms which may be substituted by aryl. When multiple units exist, R₇'s each independently have the above meaning for each unit.)

10 Specific examples of a second component to be copolymerized include a cyclic diester of α-hydroxycarboxylic acid, or a lactone as an intramolecular ring-closed compound of ω-hydroxycarboxylic acid. Furthermore, specific
15 examples of the cyclic diester of α-hydroxycarboxylic acid include intramolecular cyclic diesters of glycolic acid, lactic acid, α-hydroxybutyric acid, α-hydroxyisobutyric acid, α-hydroxyvaleric acid, α-hydroxyisovaleric acid, α-hydroxy-α-methylbutyric
20 acid, α-hydroxycaproic acid, α-hydroxyisocaproic acid, α-hydroxy-β-methylvaleric acid, α-hydroxyheptanoic acid, mandelic acid, β-phenyllactic acid, and the like. One having asymmetric carbon may be of any one of an L compound, a D compound, a racemic compound,

and a meso compound. In addition, no problem arises even when the cyclic diester is formed of different α -hydroxy acids. Specific examples thereof include cyclic diesters of glycolic acid and lactic acid such as 3-methyl-2,5-diketo-1,4-dioxane. Examples of the lactone as an intramolecular ring-closed compound of ω -hydroxycarboxylic acid include, but not limited to, intramolecular closed-circular compounds of β -propiolactone, β -butyrolactone, β -isovalerolactone, β -caprolactone, β -isocaprolactone, β -methyl- β -valerolactone, γ -butyrolactone, γ -valerolactone, δ -valerolactone, ϵ -caprolactone, lactone 11-oxydecanoate, p-dioxanone, 1,5-dioxepane-2-one, and the like.

The number average molecular weight of a polyhydroxyalkanoate to be produced by polymerization can vary widely by changing conditions including the kind and amount of the polymerization catalyst, the polymerization temperature, and the polymerization time. However, the number average molecular weight is preferably in the range of 1,000 to 1,000,000.

The molecular weight of the polyhydroxyalkanoate of the present invention can be measured as a relative molecular weight or an absolute molecular weight. The molecular weight can be simply measured by means of, for example, gel permeation chromatography (GPC). A specific

measurement method by means of GPC is as follows.
The polyhydroxyalkanoate is dissolved in advance into
a solvent into which the polyhydroxyalkanoate is
soluble, and the molecular weight is measured in a
5 mobile phase of the same solvent. A differential
refractometer (RI) or an ultraviolet (UV) detector
can be used as a detector depending on the
polyhydroxyalkanoate to be measured. The molecular
weight is determined as a result of relative
10 comparison with a standard sample (such as
polystyrene or polymethyl methacrylate). The solvent
can be selected from solvents into each of which a
polymer is soluble such as dimethylformamide (DMF),
dimethyl sulfoxide (DMSO), chloroform,
15 tetrahydrofuran (THF), toluene, and
hexafluoroisopropanol (HFIP). In the case of a polar
solvent, the molecular weight can be measured through
addition of a salt.

In addition, out of the above
20 polyhydroxyalkanoates, a polyhydroxyalkanoate having
a ratio (M_w/M_n) between a weight average molecular
weight (M_w) and a number average molecular weight
(M_n) measured as described above in the range of 1 to
10 is preferably used in the present invention.

25 A reaction solvent, a reaction temperature, a
reaction time, a purification method, and the like in
a chemical reaction of the present invention are not

limited to those described above.

[EXAMPLES]

Hereinafter, the present invention will be described in more detail by way of examples. However,
5 the present invention is not limited to these examples.

First, Preparation Examples collectively describe the materials used in the following examples.
(Preparation Example)

10 The raw materials used in the examples can be prepared according to the following methods.

(Preparation Example 1)

Method of producing 3-(2-propenyl)-2-oxetanone represented by chemical formula (20) described in
15 Example 1

3-(2-propenyl)-2-oxetanone represented by the chemical formula (20) described in Example 1 can be synthesized by using β -propiolactone instead of γ -butyrolactone in the synthesis of dihydro-3-(2-propenyl)furan-2(3H)-one described in Journal of
20 American Chemical Society 1995, 117, 3705-3716 (the compound (6a) in the non-patent document).

To be specific, 7.20 g (100.0 mmol) of β -propiolactone were placed in a round-bottomed flask,
25 and 55 ml of THF were added to dissolve this. The flask was placed under a nitrogen atmosphere, and the solution was stirred at -78°C . Next, 55 ml of a

solution of 2 M of lithium diisopropylamide in THF were gradually added to the flask, and the whole was stirred at -78°C for 20 minutes. Next, 14.52 g (110.0 mmol) of allyl bromide dissolved into 38 ml of

5 hexamethylphosphoramide (HMPA) were added to the flask, and the whole was stirred at -30°C for 3 hours. After the completion of the reaction, the reaction solution was poured into an aqueous solution of ammonium chloride, and dichloromethane was added to

10 extract the organic layer. The extracted organic layer was washed with water 3 times. After that, the organic layer was collected and dried with anhydrous sodium sulfate. After sodium sulfate had been removed, the solution was distilled off to collect

15 crude 3-(2-propenyl)-2-oxetanone. Next, the crude product was purified by means of silica gel column chromatography, and the purified product was distilled under reduced pressure to prepare 9.42 g of 3-(2-propenyl)-2-oxetanone of interest. NMR analysis

20 was performed under the following conditions to determine the structure of the resultant compound.

<Measuring equipment> FT-NMR: Bruker DPX 400

Resonance frequency: ^1H = 400 MHz

<Measurement conditions> Measured nuclear species: ^1H

25 Solvent used: CDCl_3

Measurement temperature: room temperature

The analysis confirmed that the resultant

compound was 3-(2-propenyl)-2-oxetanone of interest.
(Preparation Example 2)

Method of producing 3-(3-butenyl)-2-oxetanone
represented by chemical formula (25) described in

5 Example 5

9.46 g of 3-(3-butenyl)-2-oxetanone of interest
was prepared in the same manner as in Example 1
except that 4-bromo-1-butene was used instead of
allyl bromide described in Preparation Example 1.

10 (Preparation Example 3)

Method of producing 3-(5-hexenyl)-2-oxetanone
represented by chemical formula (27) described in
Example 6

10.79 g of 3-(5-hexenyl)-2-oxetanone of
15 interest was prepared in the same manner as in
Example 1 except that 19.57 g (110.0 mmol) of 6-
bromo-1-hexene was used instead of allyl bromide
described in Preparation Example 1.

(Preparation Example 4)

20 Method of producing 3-(9-decenyl)-2-oxetanone
represented by chemical formula (29) described in
Example 7

15.14 g of 3-(9-decenyl)-2-oxetanone of
interest was prepared in the same manner as in
25 Example 1 except that 26.30 g (110.0 mmol) of 10-
bromo-1-decene was used instead of allyl bromide
described in Preparation Example 1.

(Preparation Example 5)

Method of producing 3-(2-propenyl)dihydro-2(3H)-furanone represented by chemical formula (31) described in each of Examples 8 and 9

5 10.72 g of 3-(2-propenyl)dihydro-2(3H)-furanone of interest was prepared in the same manner as in Example 1 except that 8.61 g (100.0 mmol) of γ -butyrolactone was used instead of β -propiolactone described in Preparation Example 1.

10 (Preparation Example 6)

Method of producing 3-(3-butenyl)dihydro-2(3H)-furanone represented by chemical formula (34) described in Example 10

11.21 g of 3-(3-butenyl)dihydro-2(3H)-furanone
15 of interest was prepared in the same manner as in Example 1 except that 8.61 g (100.0 mmol) of γ -butyrolactone and 16.20 g (110.0 mmol) of 4-bromo-1-butene were used instead of β -propiolactone and allyl bromide described in Preparation Example 1.

20 (Preparation Example 7)

Method of producing 3-(5-hexenyl)dihydro-2(3H)-furanone represented by chemical formula (36) described in Example 11

12.62 g of 3-(5-hexenyl)dihydro-2(3H)-furanone
25 of interest were prepared in the same manner as in Example 1 except that 8.61 g (100.0 mmol) of γ -butyrolactone and 19.57 g (110.0 mmol) of 6-bromo-1-

hexene were used instead of β -propiolactone and allyl bromide described in Preparation Example 1.

(Preparation Example 8)

Method of producing tetrahydro-3-(2-propenyl)-
5 2H-pyrane-2-one represented by chemical formula (37)
described in each of Examples 12 to 15

9.81 g of tetrahydro-3-(2-propenyl)-2H-pyrane-
2-one of interest was prepared in the same manner as
in Example 1 except that 10.01 g (100.0 mmol) of δ -
10 valerolactone was used instead of β -propiolactone
described in Preparation Example 1.

(Preparation Example 9)

Method of producing tetrahydro-4-(3-butenyl)-
2H-pyrane-2-one represented by chemical formula (42)
15 described in each of Examples 16 and 17

10.02 g of tetrahydro-3-(2-propenyl)-2H-pyrane-
2-one of interest was prepared in the same manner as
in Example 1 except that 10.01 g (100.0 mmol) of δ -
valerolactone and 16.20 g (110.0 mmol) of 4-bromo-1-
20 butene were used instead of β -propiolactone and allyl
amide described in Preparation Example 1.

(Preparation Example 10)

Method of producing tetrahydro-4-(3-butenyl)-
2H-pyrane-2-one represented by chemical formula (45)
25 described in Example 18

10.09 g of tetrahydro-4-(3-butenyl)-2H-pyrane-
2-one of interest was prepared in the same manner as

in Example 1 except that 10.01 g (100.0 mmol) of δ -valerolactone and 17.88 g (110.0 mmol) of 5-bromo-1-pentene were used instead of β -propiolactone and allyl amide described in Preparation Example 1.

5 (Preparation Example 11)

Method of producing tetrahydro-3-(7-octenyl)-2H-pyrane-2-one represented by chemical formula (47) described in Example 19

13.25 g of tetrahydro-3-(7-octenyl)-2H-pyrane-
10 2-one of interest was prepared in the same manner as in Example 1 except that 10.01 g (100.0 mmol) of δ -valerolactone and 22.93 g (110.0 mmol) of 8-bromo-1-octene were used instead of β -propiolactone and allyl amide described in Preparation Example 1.

15 (Preparation Example 12)

Method of producing tetrahydro-3-(9-decenyl)-2H-pyrane-2-one represented by chemical formula (49) described in Example 20

14.30 g of tetrahydro-3-(9-decenyl)-2H-pyrane-
20 2-one of interest was prepared in the same manner as in Example 1 except that 10.01 g (100.0 mmol) of δ -valerolactone and 26.30 g (110.0 mmol) of 10-bromo-1-decene were used instead of β -propiolactone and allyl amide described in Preparation Example 1.

25 (Preparation Example 13)

Method of producing 3-(2-propenyl)-2-oxepanone represented by chemical formula (51) described in

Example 21

10.02 g of 3-(2-propenyl)-2-oxepanone of interest was prepared in the same manner as in Example 1 except that 11.41 g (100.0 mmol) of ϵ -caprolactone was used instead of β -propiolactone described in Preparation Example 1.
(Preparation Example 14)

Method of producing 3-(3-butenyl)-2-oxepanone represented by chemical formula (53) described in
10 Example 22

10.09 g of 3-(3-butenyl)-2-oxepanone of interest were prepared in the same manner as in Example 1 except that 11.41 g (100.0 mmol) of ϵ -caprolactone and 16.20 g (110.0 mmol) of 4-bromo-1-butene were used instead of β -propiolactone and allyl amide described in Preparation Example 1.

Hereinafter, specific examples will be shown.
(Example 1)

[Synthesis of polyester using 3-(2-propenyl)-2-oxetanone represented by chemical formula (20)]
20

1.12 g (10.0 mmol) of 3-(2-propenyl)-2-oxetanone represented by the chemical formula (20), 4.0 ml of a solution of 0.01 M of tin octylate(tin 2-

ethylhexanoate) in toluene, and 4.0 ml of a solution of 0.01 M of p-tert-butylbenzyl alcohol in toluene were placed in a polymerization ampule, and the whole was dried under reduced pressure for 1 hour and
5 replaced with nitrogen. After that, the ampule was heat-sealed under reduced pressure and heated to 150°C to perform ring-opening polymerization. 12 hours after that, the reaction was terminated, and the ampule was cooled. The resultant polymer was
10 dissolved into chloroform, and reprecipitated in methanol in an amount 10 times that of chloroform necessary for the dissolution. The precipitate was collected and dried under reduced pressure to prepare 0.35 g of a polymer.

15 NMR analysis was performed under the following conditions to determine the structure of the resultant polymer.

<Measuring equipment> FT-NMR: Bruker DPX 400

Resonance frequency: ^1H = 400 MHz

20 <Measurement conditions> Measured nuclear species: ^1H

Solvent used: TMS/ CDCl_3

Measurement temperature: room temperature

The analysis confirmed that the resultant polymer was a polyhydroxyalkanoate composed of a unit
25 represented by the following chemical formula (21).

(21)

The resultant polyhydroxyalkanoate was evaluated for average molecular weight by means of gel permeation chromatography (GPC; HLC-8220 manufactured by Tosoh Corporation, column; TSK-GEL Super HM-H manufactured by Tosoh Corporation, solvent; chloroform, polystyrene conversion). As a result, the resultant polyhydroxyalkanoate was found to have a number average molecular weight M_n of 5,800 and a weight average molecular weight M_w of 7,100.

(Example 2)

[Synthesis of polyester using 3-(2-propenyl)-2-oxetanone and L-lactide]

0.22 g (2.0 mmol) of 3-(2-propenyl)-2-oxetanone represented by the chemical formula (20), 1.44 g (10.0 mmol) of L-lactide, 4.8 ml of a solution of 0.01 M of tin octylate (tin 2-ethylhexanoate) in toluene, and 4.8 ml of a solution of 0.01 M of *p*-tert-butylbenzyl alcohol in toluene were placed in a polymerization ampule. After that, 1.20 g of a polymer were prepared in the same manner as in Example 1. NMR analysis was performed under the same

conditions as those of Example 1 to determine the structure of the resultant polymer. The analysis confirmed that the polymer was a polyhydroxyalkanoate copolymer containing a unit represented by the

5 following chemical formula (22) as a monomer unit.

The analysis also confirmed that an A unit accounted for 9 mol% of the monomer unit and a B unit accounted for 91 mol% thereof.

10 The resultant polyhydroxyalkanoate was evaluated for average molecular weight in the same manner as in Example 1. As a result, the resultant polyhydroxyalkanoate was found to have a number average molecular weight M_n of 28,500 and a weight

15 average molecular weight M_w of 38,500.

(Example 3)

[Synthesis of polyester using 3-(2-propenyl)-2-oxetanone and mandelide(3,6-diphenyl-1,4-dioxane-2,5-dione)]

20 0.22 g (2.0 mmol) of 3-(2-propenyl)-2-oxetanone represented by the chemical formula (20), 2.68 g

(10.0 mmol) of mandelide, 4.8 ml of a solution of 0.01 M of tin octylate (tin 2-ethylhexanoate) in toluene, and 4.8 ml of a solution of 0.01 M of p-tert-butylbenzyl alcohol in toluene were placed in a polymerization ampule. After that, 1.88 g of a polymer were prepared in the same manner as in Example 1. NMR analysis was performed under the same conditions as those of Example 1 to determine the structure of the resultant polymer. The analysis confirmed that the polymer was a polyhydroxyalkanoate copolymer containing a unit represented by the following chemical formula (23) as a monomer unit. The analysis also confirmed that an A unit accounted for 10 mol% of the monomer unit and a B unit accounted for 90 mol% thereof.

The resultant polyhydroxyalkanoate was evaluated for average molecular weight in the same manner as in Example 1. As a result, the resultant polyhydroxyalkanoate was found to have a number average molecular weight M_n of 23,500 and a weight

average molecular weight Mw of 35,000.

(Example 4)

[Synthesis of polyester using 3-(2-propenyl)-2-oxetanone and δ -valerolactone]

5 0.22 g (2.0 mmol) of 3-(2-propenyl)-2-oxetanone
represented by the chemical formula (20), 1.00 g
(10.0 mmol) of δ -valerolactone, 4.8 ml of a solution
of 0.01 M of tin octylate (tin 2-ethylhexanoate) in
toluene, and 4.8 ml of a solution of 0.01 M of p-
10 tert-butylbenzyl alcohol in toluene were placed in a
polymerization ampule. After that, 0.80 g of a
polymer was prepared in the same manner as in Example
1. NMR analysis was performed under the same
conditions as those of Example 1 to determine the
15 structure of the resultant polymer. The analysis
confirmed that the polymer was a polyhydroxyalkanoate
copolymer containing a unit represented by the
following chemical formula (24) as a monomer unit.
The analysis also confirmed that an A unit accounted
20 for 16 mol% of the monomer unit and a B unit
accounted for 84 mol% thereof.

The resultant polyhydroxyalkanoate was evaluated for average molecular weight in the same manner as in Example 1. As a result, the resultant polyhydroxyalkanoate was found to have a number
5 average molecular weight Mn of 19,800 and a weight average molecular weight Mw of 28,900.

(Example 5)

[Synthesis of polyester using 3-(3-butenyl)-2-oxetanone represented by chemical formula (25) and L-lactide]
10 lactide]

0.25 g (2.0 mmol) of 3-(3-butenyl)-2-oxetanone represented by the chemical formula (25), 1.44 g (10.0 mmol) of L-lactide, 4.8 ml of a solution of
15 0.01 M of tin octylate(2-tin ethylhexanoate) in toluene, and 4.8 ml of a solution of 0.01 M of p-tert-butylbenzyl alcohol in toluene were placed in a polymerization ampule. After that, 0.94 g of a polymer was prepared in the same manner as in Example
20 1. NMR analysis was performed under the same conditions as those of Example 1 to determine the structure of the resultant polymer. The analysis confirmed that the polymer was a polyhydroxyalkanoate copolymer containing a unit represented by the

following chemical formula (26) as a monomer unit.
The analysis also confirmed that an A unit accounted for 8 mol% of the monomer unit and a B unit accounted for 92 mol% thereof.

5

The resultant polyhydroxyalkanoate was evaluated for average molecular weight in the same manner as in Example 1. As a result, the resultant polyhydroxyalkanoate was found to have a number
10 average molecular weight M_n of 24,300 and a weight average molecular weight M_w of 36,700.

(Example 6)

[Synthesis of polyester using 3-(5-hexenyl)-2-oxetanone represented by chemical formula (27) and L-lactide]
15

0.31 g (2.0 mmol) of 3-(5-hexenyl)-2-oxetanone represented by the chemical formula (27), 1.44 g

(10.0 mmol) of L-lactide, 4.8 ml of a solution of 0.01 M of tin octylate (tin 2-ethylhexanoate) in toluene, and 4.8 ml of a solution of 0.01 M of p-tert-butylbenzyl alcohol in toluene were placed in a polymerization ampule. After that, 0.83 g of a polymer was prepared in the same manner as in Example 1. NMR analysis was performed under the same conditions as those of Example 1 to determine the structure of the resultant polymer. The analysis confirmed that the polymer was a polyhydroxyalkanoate copolymer containing a unit represented by the following chemical formula (28) as a monomer unit. The analysis also confirmed that an A unit accounted for 7 mol% of the monomer unit and a B unit accounted for 93 mol% thereof.

The resultant polyhydroxyalkanoate was evaluated for average molecular weight in the same manner as in Example 1. As a result, the resultant polyhydroxyalkanoate was found to have a number

average molecular weight Mn of 16,500 and a weight average molecular weight Mw of 24,400.

(Example 7)

[Synthesis of polyester using 3-(9-decenyl)-2-oxetanone represented by chemical formula (29) and L-lactide]

(29)

0.36 g (2.0 mmol) of 3-(9-decenyl)-2-oxetanone represented by the chemical formula (29), 1.44 g (10.0 mmol) of L-lactide, 4.8 ml of a solution of 0.01 M of tin octylate (tin 2-ethylhexanoate) in toluene, and 4.8 ml of a solution of 0.01 M of p-tert-butylbenzyl alcohol in toluene were placed in a polymerization ampule. After that, 0.75 g of a polymer was prepared in the same manner as in Example 1. NMR analysis was performed under the same conditions as those of Example 1 to determine the structure of the resultant polymer. The analysis confirmed that the polymer was a polyhydroxyalkanoate copolymer containing a unit represented by the following chemical formula (30) as a monomer unit. The analysis also confirmed that an A unit accounted for 4 mol% of the monomer unit and a B unit accounted for 96 mol% thereof.

The resultant polyhydroxyalkanoate was evaluated for average molecular weight in the same manner as in Example 1. As a result, the resultant polyhydroxyalkanoate was found to have a number average molecular weight M_n of 16,700 and a weight average molecular weight M_w of 23,700.

(Example 8)

[Synthesis of polyester using 3-(2-propenyl)dihydro-2(3H)-furanone represented by chemical formula (31) and L-lactide]

0.25 g (2.0 mmol) of 3-(2-propenyl)dihydro-2(3H)-furanone represented by the chemical formula

(31), 1.44 g (10.0 mmol) of L-lactide, 24 μ l of a solution of 2 M of diethylzinc in toluene, and 9.6 ml of a solution of 0.01 M of p-tert-butylbenzyl alcohol in toluene were placed in a polymerization
5 ampule. After that, 0.91 g of a polymer was prepared in the same manner as in Example 1. NMR analysis was performed under the same conditions as those of Example 1 to determine the structure of the resultant polymer. The analysis confirmed that the polymer was
10 a polyhydroxyalkanoate copolymer containing a unit represented by the following chemical formula (32) as a monomer unit. The analysis also confirmed that an A unit accounted for 5 mol% of the monomer unit and a B unit accounted for 95 mol% thereof.

15

The resultant polyhydroxyalkanoate was evaluated for average molecular weight in the same manner as in Example 1. As a result, the resultant polyhydroxyalkanoate was found to have a number
20 average molecular weight M_n of 8,200 and a weight average molecular weight M_w of 12,400.
(Example 9)

[Synthesis of polyester using 3-(2-propenyl)dihydro-2(3H)-furanone and mandelide]

0.25 g (2.0 mmol) of 3-(2-propenyl)dihydro-2(3H)-furanone represented by the chemical formula (31), 2.68 g (10.0 mmol) of mandelide, 24 μ l of a solution of 2 M of diethylzinc in toluene, and 9.6 ml of a solution of 0.01 M of p-tert-butylbenzyl alcohol in toluene were placed in a polymerization ampule. After that, 1.59 g of a polymer were prepared in the same manner as in Example 1. NMR analysis was performed under the same conditions as those of Example 1 to determine the structure of the resultant polymer. The analysis confirmed that the polymer was a polyhydroxyalkanoate copolymer containing a unit represented by the following chemical formula (33) as a monomer unit. The analysis also confirmed that an A unit accounted for 6 mol% of the monomer unit and a B unit accounted for 94 mol% thereof.

The resultant polyhydroxyalkanoate was evaluated for average molecular weight in the same manner as in Example 1. As a result, the resultant polyhydroxyalkanoate was found to have a number
5 average molecular weight Mn of 7,500 and a weight average molecular weight Mw of 11,000.
(Example 10)
[Synthesis of polyester using 3-(3-butenyl)dihydro-2(3H)-furanone represented by chemical formula (34).
10 and L-lactide]

0.28 g (2.0 mmol) of 3-(3-butenyl)dihydro-2(3H)-furanone represented by the chemical formula (34), 1.44 g (10.0 mmol) of L-lactide, 24 μ l of a
15 solution of 2 M of diethylzinc in toluene, and 9.6 ml of a solution of 0.01 M of p-tert-butylbenzyl alcohol in toluene were placed in a polymerization ampule. After that, 0.83 g of a polymer was prepared in the same manner as in Example 1. NMR analysis was
20 performed under the same conditions as those of Example 1 to determine the structure of the resultant polymer. The analysis confirmed that the polymer was

a polyhydroxyalkanoate copolymer containing a unit represented by the following chemical formula (35) as a monomer unit. The analysis also confirmed that an A unit accounted for 4 mol% of the monomer unit and a B unit accounted for 96 mol% thereof.

The resultant polyhydroxyalkanoate was evaluated for average molecular weight in the same manner as in Example 1. As a result, the resultant polyhydroxyalkanoate was found to have a number average molecular weight M_n of 6,100 and a weight average molecular weight M_w of 9,800.

(Example 11)

[Synthesis of polyester using 3-(5-hexenyl)dihydro-2(3H)-furanone represented by chemical formula (36) and L-lactide]

0.42 g (2.0 mmol) of 3-(5-hexenyl)dihydro-
2(3H)-furanone represented by the chemical formula
(36), 1.44 g (10.0 mmol) of L-lactide, 24 μ l of a
solution of 2 M of diethylzinc in toluene, and 9.6 ml
5 of a solution of 0.01 M of p-tert-butylbenzyl
alcohol in toluene were placed in a polymerization
ampule. After that, 0.72 g of a polymer was prepared
in the same manner as in Example 1. NMR analysis was
performed under the same conditions as those of
10 Example 1 to determine the structure of the resultant
polymer. The analysis confirmed that the polymer was
a polyhydroxyalkanoate copolymer containing a unit
represented by the following chemical formula (36A)
as a monomer unit. The analysis also confirmed that
15 an A unit accounted for 4 mol% of the monomer unit
and a B unit accounted for 96 mol% thereof.

The resultant polyhydroxyalkanoate was
20 evaluated for average molecular weight in the same
manner as in Example 1. As a result, the resultant

polyhydroxyalkanoate was found to have a number average molecular weight Mn of 6,200 and a weight average molecular weight Mw of 9,000.

(Example 12)

- 5 [Synthesis of polyester using tetrahydro-3-(2-propenyl)-2H-pyran-2-one represented by chemical formula (37)]

(37)

- 1.40 g (2.0 mmol) of tetrahydro-3-(2-propenyl)-
10 2H-pyran-2-one represented by the chemical formula (37), 4.0 ml of a solution of 0.01 M of tin octylate (tin 2-ethylhexanoate) in toluene, and 4.0 ml of a solution of 0.01 M of p-tert-butylbenzyl alcohol in toluene were placed in a polymerization ampule.
- 15 After that, 0.52 g of a polymer was prepared in the same manner as in Example 1. NMR analysis was performed under the same conditions as those of Example 1 to determine the structure of the resultant polymer. The analysis confirmed that the polymer was
- 20 a polyhydroxyalkanoate copolymer containing a unit represented by the following chemical formula (38) as a monomer unit.

(38)

The resultant polyhydroxyalkanoate was evaluated for average molecular weight in the same manner as in Example 1. As a result, the resultant polyhydroxyalkanoate was found to have a number average molecular weight M_n of 6,200 and a weight average molecular weight M_w of 7,400.

(Example 13)

[Synthesis of polyester using tetrahydro-3-(2-propenyl)-2H-pyrane-2-one and L-lactide]

0.28 g (2.0 mmol) of tetrahydro-3-(2-propenyl)-2H-pyrane-2-one represented by the chemical formula (37), 1.44 g (10.0 mmol) of L-lactide, 4.8 ml of a solution of 0.01 M of tin octylate (tin 2-ethylhexanoate) in toluene, and 4.8 ml of a solution of 0.01 M of p-tert-butylbenzyl alcohol in toluene were placed in a polymerization ampule. After that, 1.24 g of a polymer was prepared in the same manner as in Example 1. NMR analysis was performed under the same conditions as those of Example 1 to determine the structure of the resultant polymer. The analysis confirmed that the polymer was a

polyhydroxyalkanoate copolymer containing a unit represented by the following chemical formula (39) as a monomer unit. The analysis also confirmed that an A unit accounted for 10 mol% of the monomer unit and
 5 a B unit accounted for 90 mol% thereof.

The resultant polyhydroxyalkanoate was evaluated for average molecular weight in the same manner as in Example 1. As a result, the resultant
 10 polyhydroxyalkanoate was found to have a number average molecular weight M_n of 148,000 and a weight average molecular weight M_w of 247,200.

(Example 14)

15 [Synthesis of polyester using tetrahydro-3-(2-propenyl)-2H-pyran-2-one and L-lactide]

2.80 g (20.0 mmol) of tetrahydro-3-(2-propenyl)-2H-pyran-2-one represented by the chemical formula (37), 14.41 g (100.0 mmol) of L-lactide, 4.8
 20 ml of a solution of 0.1 M of tin octylate (tin 2-ethylhexanoate) in toluene, and 4.8 ml of a solution of 0.1 M of p-tert-butylbenzyl alcohol in toluene

were placed in a polymerization ampule. After that,
 12.93 g of a polymer was prepared in the same manner
 as in Example 1. NMR analysis was performed under
 the same conditions as those of Example 1 to
 5 determine the structure of the resultant polymer.
 The analysis confirmed that the polymer was a
 polyhydroxyalkanoate copolymer containing a unit
 represented by the following chemical formula (40) as
 a monomer unit. The analysis also confirmed that an
 10 A unit accounted for 11 mol% of the monomer unit and
 a B unit accounted for 89 mol% thereof.

The resultant polyhydroxyalkanoate was
 15 evaluated for average molecular weight in the same
 manner as in Example 1. As a result, the resultant
 polyhydroxyalkanoate was found to have a number
 average molecular weight M_n of 152,000 and a weight
 average molecular weight M_w of 252,300.

20 (Example 15)

[Synthesis of polyester using tetrahydro-3-(2-propenyl)-2H-pyran-2-one and mandelide]

0.28 g (2.0 mmol) of tetrahydro-3-(2-propenyl)-2H-pyran-2-one represented by the chemical formula (37), 2.68 g (10.0 mmol) of mandelide, 4.8 ml of a solution of 0.01 M of tin octylate (tin 2-ethylhexanoate) in toluene, and 4.8 ml of a solution of 0.01 M of p-tert-butylbenzyl alcohol in toluene were placed in a polymerization ampule. After that, 2.06 g of a polymer were prepared in the same manner as in Example 1. NMR analysis was performed under the same conditions as those of Example 1 to determine the structure of the resultant polymer. The analysis confirmed that the polymer was a polyhydroxyalkanoate copolymer containing a unit represented by the following chemical formula (41) as a monomer unit. The analysis also confirmed that an A unit accounted for 12 mol% of the monomer unit and a B unit accounted for 88 mol% thereof.

The resultant polyhydroxyalkanoate was evaluated for average molecular weight in the same manner as in Example 1. As a result, the resultant polyhydroxyalkanoate was found to have a number

average molecular weight Mn of 48,000 and a weight
average molecular weight Mw of 97,200.

(Example 16)

[Synthesis of polyester using tetrahydro-4-(3-
5 butenyl)-2H-pyran-2-one represented by chemical
formula (42) and δ -valerolactone]

(42)

0.31 g (2.0 mmol) of tetrahydro-4-(3-butenyl)-
2H-pyran-2-one represented by the chemical formula
10 (42), 1.00 g (10.0 mmol) of δ -valerolactone, 4.8 ml
of a solution of 0.01 M of tin octylate (tin 2-
ethylhexanoate) in toluene, and 4.8 ml of a solution
of 0.01 M of p-tert-butylbenzyl alcohol in toluene
were placed in a polymerization ampule. After that,
15 0.73 g of a polymer was prepared in the same manner
as in Example 1. NMR analysis was performed under
the same conditions as those of Example 1 to
determine the structure of the resultant polymer.
The analysis confirmed that the polymer was a
20 polyhydroxyalkanoate copolymer containing a unit
represented by the following chemical formula (43) as
a monomer unit. The analysis also confirmed that an
A unit accounted for 18 mol% of the monomer unit and
a B unit accounted for 82 mol% thereof.

The resultant polyhydroxyalkanoate was evaluated for average molecular weight in the same manner as in Example 1. As a result, the resultant polyhydroxyalkanoate was found to have a number average molecular weight M_n of 37,000 and a weight average molecular weight M_w of 62,200.

(Example 17)

[Synthesis of polyester using tetrahydro-4-(3-butenyl)-2H-pyran-2-one and L-lactide]

0.31 g (2.0 mmol) of tetrahydro-4-(3-butenyl)-2H-pyran-2-one represented by the chemical formula (42), 1.44 g (10.0 mmol) of L-lactide, 4.8 ml of a solution of 0.01 M of tin octylate (tin 2-ethylhexanoate) in toluene, and 4.8 ml of a solution of 0.01 M of p-tert-butylbenzyl alcohol in toluene were placed in a polymerization ampule. After that, 1.18 g of a polymer was prepared in the same manner as in Example 1. NMR analysis was performed under the same conditions as those of Example 1 to determine the structure of the resultant polymer.

The analysis confirmed that the polymer was a polyhydroxyalkanoate copolymer containing a unit represented by the following chemical formula (44) as a monomer unit. The analysis also confirmed that an

5 A unit accounted for 9 mol% of the monomer unit and a B unit accounted for 91 mol% thereof.

The resultant polyhydroxyalkanoate was evaluated for average molecular weight in the same manner as in Example 1. As a result, the resultant polyhydroxyalkanoate was found to have a number average molecular weight Mn of 78,800 and a weight average molecular weight Mw of 137,900.

10

(Example 18)

15 [Synthesis of polyester using tetrahydro-3-(4-pentenyl)-2H-pyran-2-one represented by chemical formula (45) and glycolide(1,4-dioxane-2,5-dione)]

(45)

0.34 g (2.0 mmol) of tetrahydro-3-(4-pentenyl)-
 2H-pyran-2-one represented by the chemical formula
 (45), 1.16 g (10.0 mmol) of glycolide, 4.8 ml of a
 solution of 0.01 M of tin octylate (tin 2-
 5 ethylhexanoate) in toluene, and 4.8 ml of a solution
 of 0.01 M of p-tert-butylbenzyl alcohol in toluene
 were placed in a polymerization ampule. After that,
 0.96 g of a polymer was prepared in the same manner
 as in Example 1. NMR analysis was performed under
 10 the same conditions as those of Example 1 to
 determine the structure of the resultant polymer.
 The analysis confirmed that the polymer was a
 polyhydroxyalkanoate copolymer containing a unit
 represented by the following chemical formula (46) as
 15 a monomer unit. The analysis also confirmed that an
 A unit accounted for 7 mol% of the monomer unit and a
 B unit accounted for 93 mol% thereof.

The resultant polyhydroxyalkanoate was
 20 evaluated for average molecular weight in the same

manner as in Example 1. As a result, the resultant polyhydroxyalkanoate was found to have a number average molecular weight M_n of 65,400 and a weight average molecular weight M_w of 107,200.

5 (Example 19)

[Synthesis of polyester using tetrahydro-3-(7-octenyl)-2H-pyrane-2-one represented by chemical formula (47) and L-lactide]

(47)

10 0.39 g (2.0 mmol) of tetrahydro-3-(7-octenyl)-2H-pyrane-2-one represented by the chemical formula (47), 1.44 g (10.0 mmol) of L-lactide, 4.8 ml of a solution of 0.01 M of tin octylate (tin 2-ethylhexanoate) in toluene, and 4.8 ml of a solution
15 of 0.01 M of p-tert-butylbenzyl alcohol in toluene were placed in a polymerization ampule. After that, 1.11 g of a polymer was prepared in the same manner as in Example 1. NMR analysis was performed under the same conditions as those of Example 1 to
20 determine the structure of the resultant polymer. The analysis confirmed that the polymer was a polyhydroxyalkanoate copolymer containing a unit represented by the following chemical formula (48) as a monomer unit. The analysis also confirmed that an

A unit accounted for 6 mol% of the monomer unit and a B unit accounted for 94 mol% thereof.

The resultant polyhydroxyalkanoate was
 5 evaluated for average molecular weight in the same
 manner as in Example 1. As a result, the resultant
 polyhydroxyalkanoate was found to have a number
 average molecular weight M_n of 81,400 and a weight
 average molecular weight M_w of 140,800.
 10 (Example 20)

[Synthesis of polyester using tetrahydro-3-(9-decenyl)-2H-pyran-2-one represented by chemical formula (49) and L-lactide]

15 0.48 g (2.0 mmol) of tetrahydro-3-(9-decenyl)-
 2H-pyran-2-one represented by the chemical formula

(49), 1.44 g (10.0 mmol) of L-lactide, 4.8 ml of a solution of 0.01 M of tin octylate (tin 2-ethylhexanoate) in toluene, and 4.8 ml of a solution of 0.01 M of p-tert-butylbenzyl alcohol in toluene were placed in a polymerization ampule. After that, 1.03 g of a polymer was prepared in the same manner as in Example 1. NMR analysis was performed under the same conditions as those of Example 1 to determine the structure of the resultant polymer.

10 The analysis confirmed that the polymer was a polyhydroxyalkanoate copolymer containing a unit represented by the following chemical formula (50) as a monomer unit. The analysis also confirmed that an A unit accounted for 4 mol% of the monomer unit and a B unit accounted for 96 mol% thereof.

15

The resultant polyhydroxyalkanoate was

evaluated for average molecular weight in the same manner as in Example 1. As a result, the resultant polyhydroxyalkanoate was found to have a number average molecular weight Mn of 55,000 and a weight
5 average molecular weight Mw of 90,800.

(Example 21)

[Synthesis of polyester using 3-(2-propenyl)-2-oxepanone represented by chemical formula (51) and L-lactide]

(51)

10

0.31 g (2.0 mmol) of 3-(2-propenyl)-2-oxepanone represented by the chemical formula (51), 1.44 g (10.0 mmol) of L-lactide, 4.8 ml of a solution of 0.01 M of tin octylate (tin 2-ethylhexanoate) in
15 toluene, and 4.8 ml of a solution of 0.01 M of p-tert-butylbenzyl alcohol in toluene were placed in a polymerization ampule. After that, 1.32 g of a polymer was prepared in the same manner as in Example 1. NMR analysis was performed under the same
20 conditions as those of Example 1 to determine the structure of the resultant polymer. The analysis confirmed that the polymer was a polyhydroxyalkanoate copolymer containing a unit represented by the following chemical formula (52) as a monomer unit.

The analysis also confirmed that an A unit accounted for 10 mol% of the monomer unit and a B unit accounted for 90 mol% thereof.

5 The resultant polyhydroxyalkanoate was evaluated for average molecular weight in the same manner as in Example 1. As a result, the resultant polyhydroxyalkanoate was found to have a number average molecular weight M_n of 132,000 and a weight

10 average molecular weight M_w of 220,400.

(Example 22)

[Synthesis of polyester using 3-(3-butenyl)-2-oxepanone represented by chemical formula (53) and glycolide]

15

0.34 g (2.0 mmol) of 3-(3-butenyl)-2-oxepanone represented by the chemical formula (53), 1.16 g

(10.0 mmol) of glycolide, 4.8 ml of a solution of 0.01 M of tin octylate (tin 2-ethylhexanoate) in toluene, and 4.8 ml of a solution of 0.01 M of p-tert-butylbenzyl alcohol in toluene were placed in a polymerization ampule. After that, 1.04 g of a polymer was prepared in the same manner as in Example 1. NMR analysis was performed under the same conditions as those of Example 1 to determine the structure of the resultant polymer. The analysis confirmed that the polymer was a polyhydroxyalkanoate copolymer containing a unit represented by the following chemical formula (54) as a monomer unit. The analysis also confirmed that an A unit accounted for 8 mol% of the monomer unit and a B unit accounted for 92 mol% thereof.

The resultant polyhydroxyalkanoate was evaluated for average molecular weight in the same manner as in Example 1. As a result, the resultant polyhydroxyalkanoate was found to have a number average molecular weight M_n of 128,000 and a weight

average molecular weight Mw of 208,600.

(Example 23)

Oxidation reaction of polyhydroxyalkanoate
composed of unit represented by chemical formula (21)
5 synthesized in Example 1

0.50 g of the polyhydroxyalkanoate composed of
the unit represented by the chemical formula (21)
synthesized in Example 1 was placed in a round-
10 bottomed flask, and 30 ml of acetone were added to
dissolve this. The flask was placed in an ice bath,
5 ml of acetic acid and 3.54 g of 18-crown-6-ether
were added, and the whole was stirred. Next, 2.82 g
of potassium permanganate were gradually added to the
15 flask in the ice bath, and the whole was stirred in
the ice bath for 2 hours and stirred at room
temperature for an additional 18 hours. After the
completion of the reaction, 60 ml of ethyl acetate
was added, and 45 ml of water was further added.
20 Next, sodium hydrogen sulfite was added until peracid
was removed. After that, liquid property was
adjusted with 1.0N hydrochloric acid to have a pH of
1. The organic layer was extracted and washed with

1.0N hydrochloric acid 3 times. After the organic layer had been collected, the solvent was distilled off to collect a crude polymer. Next, the polymer was washed with 50 ml of water and 50 ml of methanol, and was further washed with 50 ml of water 3 times, followed by collection of a polymer. Next, the polymer was dissolved into 3 ml of THF, and reprecipitated in methanol in an amount 50 times that of THF necessary for the dissolution. The precipitate was collected and dried under reduced pressure to prepare 0.44 g of a polymer. NMR analysis was performed under the same conditions as those of Example 1 to determine the structure of the resultant polymer. The analysis confirmed that the polymer was a polyhydroxyalkanoate containing a unit represented by the following chemical formula (55) as a monomer unit.

The resultant polyhydroxyalkanoate was evaluated for average molecular weight in the same manner as in Example 1. As a result, the resultant polyhydroxyalkanoate was found to have a number average molecular weight M_n of 4,700 and a weight

average molecular weight Mw of 6,200.

(Example 24)

Oxidation reaction of polyhydroxyalkanoate
composed of unit represented by chemical formula (22)
5 synthesized in Example 2

0.50 g of the polyhydroxyalkanoate copolymer
composed of the unit represented by the chemical
formula (22) synthesized in Example 2 (A: 9 mol%, B:
10 91 mol%) was placed in a round-bottomed flask, and 30
ml of acetone were added to dissolve this. The flask
was placed in an ice bath, 5 ml of acetic acid and
0.47 g of 18-crown-6-ether were added, and the whole
was stirred. Next, 0.38 g of potassium permanganate
15 was gradually added to the flask in the ice bath, and
the whole was stirred in the ice bath for 2 hours and
stirred at room temperature for an additional 18
hours. After the completion of the reaction, 0.43 g
of a polymer was prepared in the same manner as in
20 Example 23. NMR analysis was performed under the
same conditions as those of Example 1 to determine
the structure of the resultant polymer. The analysis

confirmed that the polymer was a polyhydroxyalkanoate containing a unit represented by the following chemical formula (56) as a monomer unit.

5 The resultant polyhydroxyalkanoate was evaluated for average molecular weight in the same manner as in Example 1. As a result, the resultant polyhydroxyalkanoate was found to have a number average molecular weight M_n of 22,300 and a weight
10 average molecular weight M_w of 30,600.

 Furthermore, in order to calculate the unit of the resultant polyhydroxyalkanoate, a carboxyl group at the terminal of a side chain of the resultant polyhydroxyalkanoate was methyl esterified with
15 trimethylsilyldiazomethane. 30 mg of the polyhydroxyalkanoate as a target product was placed in a 100-ml round-bottomed flask, and 2.1 ml of chloroform and 0.7 ml of methanol were added to dissolve this. 0.5 ml of a 2-mol/L
20 trimethylsilyldiazomethane-hexane solution was added to the solution, and the whole was stirred at room temperature for 1 hour. After the completion of the

reaction, the solvent was distilled off to collect a polymer. The polymer was washed with 50 ml of methanol to collect a polymer. The polymer was dried under reduced pressure to prepare 29 mg of a
 5 polyhydroxyalkanoate.

NMR analysis was performed in the same manner as in Example 1. The analysis confirmed that the polyhydroxyalkanoate was a copolymer in which a C unit accounted for 9 mol% of the unit of the
 10 polyhydroxyalkanoate represented by the chemical formula (56) and a D unit accounted for 91 mol% thereof.

(Example 25)

Oxidation reaction of polyhydroxyalkanoate
 15 composed of unit represented by chemical formula (23) synthesized in Example 3

0.50 g of the polyhydroxyalkanoate copolymer composed of the unit represented by the chemical
 20 formula (23) synthesized in Example 3 (A: 10 mol%, B: 90 mol%) was placed in a round-bottomed flask, and 30 ml of acetone was added to dissolve this. The flask

was placed in an ice bath, 5 ml of acetic acid and 0.30 g of 18-crown-6-ether were added, and the whole was stirred. Next, 0.24 g of potassium permanganate was gradually added to the flask in the ice bath, and
5 the whole was stirred in the ice bath for 2 hours and stirred at room temperature for an additional 18 hours. After the completion of the reaction, 0.44 g of a polymer was prepared in the same manner as in Example 23. NMR analysis was performed under the
10 same conditions as those of Example 1 to determine the structure of the resultant polymer. The analysis confirmed that the polymer was a polyhydroxyalkanoate containing a unit represented by the following chemical formula (57) as a monomer unit.

15

The resultant polyhydroxyalkanoate was evaluated for average molecular weight in the same manner as in Example 1. As a result, the resultant polyhydroxyalkanoate was found to have a number
20 average molecular weight M_n of 20,100 and a weight average molecular weight M_w of 30,400.

Furthermore, in order to calculate the unit of

the resultant polyhydroxyalkanoate, 28 mg of the polyhydroxyalkanoate prepared in the same manner as in Example 24 was subjected to NMR analysis in the same manner as in Example 1. The analysis confirmed
5 that the polyhydroxyalkanoate was a copolymer in which a C unit accounted for 10 mol% of the unit of the polyhydroxyalkanoate represented by the chemical formula (56) and a D unit accounted for 90 mol% thereof.

10 (Example 26)

Oxidation reaction of polyhydroxyalkanoate composed of unit represented by chemical formula (24) synthesized in Example 4

15 0.50 g of the polyhydroxyalkanoate copolymer composed of the unit represented by the chemical formula (24) synthesized in Example 4 (A: 16 mol%, B: 84 mol%) was placed in a round-bottomed flask, and 30 ml of acetone was added to dissolve this. The flask
20 was placed in an ice bath, 5 ml of acetic acid and 0.62 g of 18-crown-6-ether were added, and the whole was stirred. Next, 0.50 g of potassium permanganate

was gradually added to the flask in the ice bath, and the whole was stirred in the ice bath for 2 hours and stirred at room temperature for an additional 18 hours. After the completion of the reaction, 0.42 g
5 of a polymer was prepared in the same manner as in Example 23. NMR analysis was performed under the same conditions as those of Example 1 to determine the structure of the resultant polymer. The analysis confirmed that the polymer was a polyhydroxyalkanoate
10 containing a unit represented by the following chemical formula (58) as a monomer unit.

The resultant polyhydroxyalkanoate was evaluated for average molecular weight in the same
15 manner as in Example 1. As a result, the resultant polyhydroxyalkanoate was found to have a number average molecular weight Mn of 15,700 and a weight average molecular weight Mw of 23,700.

Furthermore, in order to calculate the unit of
20 the resultant polyhydroxyalkanoate, 27 mg of the polyhydroxyalkanoate prepared in the same manner as in Example 24 was subjected to NMR analysis in the

same manner as in Example 1. The analysis confirmed that the polyhydroxyalkanoate was a copolymer in which a C unit accounted for 15 mol% of the unit of the polyhydroxyalkanoate represented by the chemical formula (58) and a D unit accounted for 85 mol% thereof.

(Example 27)

Oxidation reaction of polyhydroxyalkanoate composed of unit represented by chemical formula (26) synthesized in Example 5

0.50 g of the polyhydroxyalkanoate copolymer composed of the unit represented by the chemical formula (26) synthesized in Example 5 (A: 8 mol%, B: 92 mol%) was placed in a round-bottomed flask, and 30 ml of acetone was added to dissolve this. The flask was placed in an ice bath, 5 ml of acetic acid and 0.42 g of 18-crown-6-ether were added, and the whole was stirred. Next, 0.33 g of potassium permanganate was gradually added to the flask in the ice bath, and the whole was stirred in the ice bath for 2 hours and stirred at room temperature for an additional 18

hours. After the completion of the reaction, 0.42 g of a polymer was prepared in the same manner as in Example 23. NMR analysis was performed under the same conditions as those of Example 1 to determine the structure of the resultant polymer. The analysis confirmed that the polymer was a polyhydroxyalkanoate containing a unit represented by the following chemical formula (59) as a monomer unit.

The resultant polyhydroxyalkanoate was evaluated for average molecular weight in the same manner as in Example 1. As a result, the resultant polyhydroxyalkanoate was found to have a number average molecular weight M_n of 19,800 and a weight average molecular weight M_w of 30,700.

Furthermore, in order to calculate the unit of the resultant polyhydroxyalkanoate, 29 mg of the polyhydroxyalkanoate prepared in the same manner as in Example 24 was subjected to NMR analysis in the same manner as in Example 1. The analysis confirmed that the polyhydroxyalkanoate was a copolymer in which a C unit accounted for 8 mol% of the unit of

the polyhydroxyalkanoate represented by the chemical formula (59) and a D unit accounted for 92 mol% thereof.

(Example 28)

- 5 Oxidation reaction of polyhydroxyalkanoate composed of unit represented by chemical formula (28) synthesized in Example 6

- 0.50 g of the polyhydroxyalkanoate copolymer
- 10 composed of the unit represented by the chemical formula (28) synthesized in Example 6 (A: 7 mol%, B: 93 mol%) was placed in a round-bottomed flask, and 30 ml of acetone was added to dissolve this. The flask was placed in an ice bath, 5 ml of acetic acid and
- 15 0.36 g of 18-crown-6-ether were added, and the whole was stirred. Next, 0.28 g of potassium permanganate was gradually added to the flask in the ice bath, and the whole was stirred in the ice bath for 2 hours and stirred at room temperature for an additional 18
- 20 hours. After the completion of the reaction, 0.43 g

of a polymer was prepared in the same manner as in Example 23. NMR analysis was performed under the same conditions as those of Example 1 to determine the structure of the resultant polymer. The analysis confirmed that the polymer was a polyhydroxyalkanoate containing a unit represented by the following chemical formula (60) as a monomer unit.

The resultant polyhydroxyalkanoate was evaluated for average molecular weight in the same manner as in Example 1. As a result, the resultant polyhydroxyalkanoate was found to have a number average molecular weight M_n of 13,200 and a weight average molecular weight M_w of 20,300.

Furthermore, in order to calculate the unit of the resultant polyhydroxyalkanoate, 30 mg of the polyhydroxyalkanoate prepared in the same manner as in Example 24 was subjected to NMR analysis in the same manner as in Example 1. The analysis confirmed that the polyhydroxyalkanoate was a copolymer in

which a C unit accounted for 7 mol% of the unit of the polyhydroxyalkanoate represented by the chemical formula (60) and a D unit accounted for 93 mol% thereof.

5 (Example 29)

Oxidation reaction of polyhydroxyalkanoate composed of unit represented by chemical formula (30) synthesized in Example 7

10 0.50 g of the polyhydroxyalkanoate copolymer composed of the unit represented by the chemical formula (30) synthesized in Example 7 (A: 4 mol%, B: 96 mol%) was placed in a round-bottomed flask, and 30 ml of acetone was added to dissolve this. The flask
15 was placed in an ice bath, 5 ml of acetic acid and 0.21 g of 18-crown-6-ether were added, and the whole was stirred. Next, 0.17 g of potassium permanganate

was gradually added to the flask in the ice bath, and the whole was stirred in the ice bath for 2 hours and stirred at room temperature for an additional 18 hours. 0.44 g of a polymer was prepared in the same manner as in Example 23. NMR analysis was performed under the same conditions as those of Example 1 to determine the structure of the resultant polymer. The analysis confirmed that the polymer was a polyhydroxyalkanoate containing a unit represented by the following chemical formula (61) as a monomer unit.

The resultant polyhydroxyalkanoate was evaluated for average molecular weight in the same manner as in Example 1. As a result, the resultant polyhydroxyalkanoate was found to have a number average molecular weight M_n of 13,100 and a weight average molecular weight M_w of 19,100.

Furthermore, in order to calculate the unit of the resultant polyhydroxyalkanoate, 29 mg of the polyhydroxyalkanoate prepared in the same manner as in Example 24 was subjected to NMR analysis in the same manner as in Example 1. The analysis confirmed that the polyhydroxyalkanoate was a copolymer in which a C unit accounted for 4 mol% of the unit of the polyhydroxyalkanoate represented by the chemical formula (61) and a D unit accounted for 96 mol% thereof.
(Example 30)

Oxidation reaction of polyhydroxyalkanoate composed of unit represented by chemical formula (32) synthesized in Example 8

15

0.50 g of the polyhydroxyalkanoate copolymer composed of the unit represented by the chemical formula (32) synthesized in Example 8 (A: 5 mol%, B: 95 mol%) was placed in a round-bottomed flask, and 30 ml of acetone was added to dissolve this. The flask was placed in an ice bath, 5 ml of acetic acid and 0.26 g of 18-crown-6-ether were added, and the whole

was stirred. Next, 0.21 g of potassium permanganate was gradually added to the flask in the ice bath, and the whole was stirred in the ice bath for 2 hours and stirred at room temperature for an additional 18
 5 hours. 0.45 g of a polymer was prepared in the same manner as in Example 23. NMR analysis was performed under the same conditions as those of Example 1 to determine the structure of the resultant polymer. The analysis confirmed that the polymer was a
 10 polyhydroxyalkanoate containing a unit represented by the following chemical formula (62) as a monomer unit.

The resultant polyhydroxyalkanoate was evaluated for average molecular weight in the same
 15 manner as in Example 1. As a result, the resultant polyhydroxyalkanoate was found to have a number average molecular weight M_n of 7,800 and a weight average molecular weight M_w of 12,200.

Furthermore, in order to calculate the unit of
 20 the resultant polyhydroxyalkanoate, 29 mg of the polyhydroxyalkanoate prepared in the same manner as in Example 24 was subjected to NMR analysis in the

same manner as in Example 1. The analysis confirmed that the polyhydroxyalkanoate was a copolymer in which a C unit accounted for 5 mol% of the unit of the polyhydroxyalkanoate represented by the chemical
5 formula (62) and a D unit accounted for 95 mol% thereof.

(Example 31)

Oxidation reaction of polyhydroxyalkanoate composed of unit represented by chemical formula (33)
10 synthesized in Example 9

0.50 g of the polyhydroxyalkanoate copolymer composed of the unit represented by the chemical formula (33) synthesized in Example 9 (A: 6 mol%, B:
15 94 mol%) was placed in a round-bottomed flask, and 30 ml of acetone was added to dissolve this. The flask was placed in an ice bath, 5 ml of acetic acid and 0.18 g of 18-crown-6-ether were added, and the whole was stirred. Next, 0.14 g of potassium permanganate
20 was gradually added to the flask in the ice bath, and the whole was stirred in the ice bath for 2 hours and

stirred at room temperature for an additional 18 hours. 0.44 g of a polymer was prepared in the same manner as in Example 23. NMR analysis was performed under the same conditions as those of Example 1 to
5 determine the structure of the resultant polymer. The analysis confirmed that the polymer was a polyhydroxyalkanoate containing a unit represented by the following chemical formula (63) as a monomer unit.

10 The resultant polyhydroxyalkanoate was evaluated for average molecular weight in the same manner as in Example 1. As a result, the resultant polyhydroxyalkanoate was found to have a number
15 average molecular weight M_n of 7,300 and a weight average molecular weight M_w of 11,100.

 Furthermore, in order to calculate the unit of the resultant polyhydroxyalkanoate, 28 mg of the polyhydroxyalkanoate prepared in the same manner as in Example 24 was subjected to NMR analysis in the
20 same manner as in Example 1. The analysis confirmed that the polyhydroxyalkanoate was a copolymer in

which a C unit accounted for 6 mol% of the unit of the polyhydroxyalkanoate represented by the chemical formula (63) and a D unit accounted for 94 mol% thereof.

5 (Example 32)

Oxidation reaction of polyhydroxyalkanoate composed of unit represented by chemical formula (35) synthesized in Example 10

10 0.50 g of the polyhydroxyalkanoate copolymer composed of the unit represented by the chemical formula (35) synthesized in Example 10 (A: 4 mol%, B: 96 mol%) was placed in a round-bottomed flask, and 30 ml of acetone was added to dissolve this. The flask
15 was placed in an ice bath, 5 ml of acetic acid and 0.21 g of 18-crown-6-ether were added, and the whole was stirred. Next, 0.17 g of potassium permanganate was gradually added to the flask in the ice bath, and the whole was stirred in the ice bath for 2 hours and
20 stirred at room temperature for an additional 18 hours. After the completion of the reaction, 0.44 g

of a polymer was prepared in the same manner as in Example 23. NMR analysis was performed under the same conditions as those of Example 1 to determine the structure of the resultant polymer. The analysis confirmed that the polymer was a polyhydroxyalkanoate containing a unit represented by the following chemical formula (64) as a monomer unit.

The resultant polyhydroxyalkanoate was evaluated for average molecular weight in the same manner as in Example 1. As a result, the resultant polyhydroxyalkanoate was found to have a number average molecular weight M_n of 5,800 and a weight average molecular weight M_w of 9,500.

Furthermore, in order to calculate the unit of the resultant polyhydroxyalkanoate, 29 mg of the polyhydroxyalkanoate prepared in the same manner as in Example 24 was subjected to NMR analysis in the same manner as in Example 1. The analysis confirmed that the polyhydroxyalkanoate was a copolymer in which a C unit accounted for 4 mol% of the unit of

the polyhydroxyalkanoate represented by the chemical formula (64) and a D unit accounted for 96 mol% thereof.

(Example 33)

- 5 Oxidation reaction of polyhydroxyalkanoate composed of unit represented by chemical formula (37) synthesized in Example 11

- 10 0.50 g of the polyhydroxyalkanoate copolymer composed of the unit represented by the chemical formula (36A) synthesized in Example 11 (A: 4 mol%, B: 96 mol%) was placed in a round-bottomed flask, and 30 ml of acetone were added to dissolve this. The
- 15 flask was placed in an ice bath, 5 ml of acetic acid and 0.20 g of 18-crown-6-ether were added, and the whole was stirred. Next, 0.16 g of potassium permanganate was gradually added to the flask in the ice bath, and the whole was stirred in the ice bath
- 20 for 2 hours and stirred at room temperature for an additional 18 hours. After the completion of the

reaction, 0.43 g of a polymer was prepared in the same manner as in Example 23. NMR analysis was performed under the same conditions as those of Example 1 to determine the structure of the resultant polymer. The analysis confirmed that the polymer was a polyhydroxyalkanoate containing a unit represented by the following chemical formula (65) as a monomer unit.

The resultant polyhydroxyalkanoate was evaluated for average molecular weight in the same manner as in Example 1. As a result, the resultant polyhydroxyalkanoate was found to have a number average molecular weight M_n of 5,200 and a weight average molecular weight M_w of 7,900.

Furthermore, in order to calculate the unit of the resultant polyhydroxyalkanoate, 28 mg of the polyhydroxyalkanoate prepared in the same manner as in Example 24 was subjected to NMR analysis in the same manner as in Example 1. The analysis confirmed

that the polyhydroxyalkanoate was a copolymer in which a C unit accounted for 4 mol% of the unit of the polyhydroxyalkanoate represented by the chemical formula (65) and a D unit accounted for 96 mol% thereof.

(Example 34)

Oxidation reaction of polyhydroxyalkanoate composed of unit represented by chemical formula (38) synthesized in Example 12

10

0.50 g of the polyhydroxyalkanoate composed of the unit represented by the chemical formula (38) synthesized in Example 12 was placed in a round-bottomed flask, and 30 ml of acetone was added to dissolve this. The flask was placed in an ice bath, 5 ml of acetic acid and 2.83 g of 18-crown-6-ether were added, and the whole was stirred. Next, 2.25 g of potassium permanganate was gradually added to the flask in the ice bath, and the whole was stirred in the ice bath for 2 hours and stirred at room temperature for an additional 18 hours. After the completion of the reaction, 0.43 g of a polymer was

20

prepared in the same manner as in Example 23. NMR analysis was performed under the same conditions as those of Example 1 to determine the structure of the resultant polymer. The analysis confirmed that the polymer was a polyhydroxyalkanoate containing a unit represented by the following chemical formula (66) as a monomer unit.

The resultant polyhydroxyalkanoate was evaluated for average molecular weight in the same manner as in Example 1. As a result, the resultant polyhydroxyalkanoate was found to have a number average molecular weight M_n of 5,300 and a weight average molecular weight M_w of 6,500.

(Example 35)

Oxidation reaction of polyhydroxyalkanoate composed of unit represented by chemical formula (39) synthesized in Example 13

0.50 g of the polyhydroxyalkanoate copolymer composed of the unit represented by the chemical formula (39) synthesized in Example 13 (A: 10 mol%, B: 90 mol%) was placed in a round-bottomed flask, and 30 ml of acetone were added to dissolve this. The flask was placed in an ice bath, 5 ml of acetic acid and 0.50 g of 18-crown-6-ether were added, and the whole was stirred. Next, 0.40 g of potassium permanganate was gradually added to the flask in the ice bath, and the whole was stirred in the ice bath for 2 hours and stirred at room temperature for an additional 18 hours. After the completion of the reaction, 0.45 g of a polymer was prepared in the same manner as in Example 23. NMR analysis was performed under the same conditions as those of Example 1 to determine the structure of the resultant polymer. The analysis confirmed that the polymer was a polyhydroxyalkanoate containing a unit represented by the following chemical formula (67) as a monomer unit.

C

D

(67)

The resultant polyhydroxyalkanoate was evaluated for average molecular weight in the same manner as in Example 1. As a result, the resultant polyhydroxyalkanoate was found to have a number
 5 average molecular weight Mn of 117,300 and a weight average molecular weight Mw of 206,400.

Furthermore, in order to calculate the unit of the resultant polyhydroxyalkanoate, 29 mg of the polyhydroxyalkanoate prepared in the same manner as
 10 in Example 24 was subjected to NMR analysis in the same manner as in Example 1. The analysis confirmed that the polyhydroxyalkanoate was a copolymer in which a C unit accounted for 10 mol% of the unit of the polyhydroxyalkanoate represented by the chemical
 15 formula (67) and a D unit accounted for 90 mol% thereof.

(Example 36)

Oxidation reaction of polyhydroxyalkanoate composed of unit represented by chemical formula (40)
 20 synthesized in Example 14

5.00 g of the polyhydroxyalkanoate copolymer composed of the unit represented by the chemical formula (40) synthesized in Example 14 (A: 11 mol%, B: 89 mol%) was placed in a round-bottomed flask, and 300 ml of acetone was added to dissolve this. The flask was placed in an ice bath, 50 ml of acetic acid and 5.48 g of 18-crown-6-ether were added, and the whole was stirred. Next, 4.37 g of potassium permanganate was gradually added to the flask in the ice bath, and the whole was stirred in the ice bath for 2 hours and stirred at room temperature for an additional 18 hours. After the completion of the reaction, 600 ml of ethyl acetate were added, and 450 ml of water were further added. Next, sodium hydrogen sulfite was added until peracid was removed. After that, liquid property was adjusted with 1.0N hydrochloric acid to have a pH of 1. The organic layer was extracted and washed with 1.0N hydrochloric acid 3 times. After the organic layer had been collected, the solvent was distilled off to collect a crude polymer. Next, the polymer was washed with 500 ml of water and 500 ml of methanol, and was further washed with 500 ml of water 3 times, followed by collection of a polymer. Next, the polymer was dissolved into 30 ml of THF, then dissolved into THF, and reprecipitated in methanol in an amount 50 times that of THF necessary for the dissolution. The

precipitate was collected and dried under reduced pressure to prepare 4.51 g of a polymer. NMR analysis was performed under the same conditions as those of Example 1 to determine the structure of the resultant polymer. The analysis confirmed that the polymer was a polyhydroxyalkanoate containing a unit represented by the following chemical formula (68) as a monomer unit.

The resultant polyhydroxyalkanoate was evaluated for average molecular weight in the same manner as in Example 1. As a result, the resultant polyhydroxyalkanoate was found to have a number average molecular weight M_n of 123,500 and a weight average molecular weight M_w of 202,500.

Furthermore, in order to calculate the unit of the resultant polyhydroxyalkanoate, 28 mg of the polyhydroxyalkanoate prepared in the same manner as in Example 24 was subjected to NMR analysis in the same manner as in Example 1. The analysis confirmed that the polyhydroxyalkanoate was a copolymer in

which a C unit accounted for 10 mol% of the unit of the polyhydroxyalkanoate represented by the chemical formula (68) and a D unit accounted for 90 mol% thereof.

5 (Example 37)

Oxidation reaction of polyhydroxyalkanoate composed of unit represented by chemical formula (41) synthesized in Example 15

10 0.50 g of the polyhydroxyalkanoate copolymer composed of the unit represented by the chemical formula (41) synthesized in Example 15 (A: 12 mol%, B: 88 mol%) was placed in a round-bottomed flask, and 30 ml of acetone was added to dissolve this. The
15 flask was placed in an ice bath, 5 ml of acetic acid and 0.35 g of 18-crown-6-ether were added, and the whole was stirred. Next, 0.28 g of potassium permanganate was gradually added to the flask in the ice bath, and the whole was stirred in the ice bath
20 for 2 hours and stirred at room temperature for an additional 18 hours. After the completion of the

reaction, 0.44 g of a polymer was prepared in the same manner as in Example 23. NMR analysis was performed under the same conditions as those of Example 1 to determine the structure of the resultant polymer. The analysis confirmed that the polymer was a polyhydroxyalkanoate containing a unit represented by the following chemical formula (69) as a monomer unit.

The resultant polyhydroxyalkanoate was evaluated for average molecular weight in the same manner as in Example 1. As a result, the resultant polyhydroxyalkanoate was found to have a number average molecular weight M_n of 38,600 and a weight average molecular weight M_w of 69,100.

Furthermore, in order to calculate the unit of the resultant polyhydroxyalkanoate, 28 mg of the polyhydroxyalkanoate prepared in the same manner as in Example 24 was subjected to NMR analysis in the same manner as in Example 1. The analysis confirmed that the polyhydroxyalkanoate was a copolymer in

which a C unit accounted for 11 mol% of the unit of the polyhydroxyalkanoate represented by the chemical formula (69) and a D unit accounted for 89 mol% thereof.

5 (Example 38)

Oxidation reaction of polyhydroxyalkanoate composed of unit represented by chemical formula (43) synthesized in Example 16

10 0.50 g of the polyhydroxyalkanoate copolymer composed of the unit represented by the chemical formula (43) synthesized in Example 17 (A: 18 mol%, B: 82 mol%) was placed in a round-bottomed flask, and 30 ml of acetone was added to dissolve this. The
15 flask was placed in an ice bath, 5 ml of acetic acid and 0.82 g of 18-crown-6-ether were added, and the whole was stirred. Next, 0.66 g of potassium permanganate was gradually added to the flask in the ice bath, and the whole was stirred in the ice bath
20 for 2 hours and stirred at room temperature for an additional 18 hours. After the completion of the

reaction, 0.44 g of a polymer was prepared in the same manner as in Example 23. NMR analysis was performed under the same conditions as those of Example 1 to determine the structure of the resultant polymer. The analysis confirmed that the polymer was a polyhydroxyalkanoate containing a unit represented by the following chemical formula (70) as a monomer unit.

The resultant polyhydroxyalkanoate was evaluated for average molecular weight in the same manner as in Example 1. As a result, the resultant polyhydroxyalkanoate was found to have a number average molecular weight M_n of 31,500 and a weight average molecular weight M_w of 54,200.

Furthermore, in order to calculate the unit of the resultant polyhydroxyalkanoate, 29 mg of the polyhydroxyalkanoate prepared in the same manner as in Example 24 was subjected to NMR analysis in the same manner as in Example 1. The analysis confirmed that the polyhydroxyalkanoate was a copolymer in

which a C unit accounted for 16 mol% of the unit of the polyhydroxyalkanoate represented by the chemical formula (70) and a D unit accounted for 84 mol% thereof.

5 (Example 39)

Oxidation reaction of polyhydroxyalkanoate composed of unit represented by chemical formula (44) synthesized in Example 17

10 0.50 g of the polyhydroxyalkanoate copolymer composed of the unit represented by the chemical formula (44) synthesized in Example 17 (A: 9 mol%, B: 91 mol%) was placed in a round-bottomed flask, and 30 ml of acetone was added to dissolve this. The flask
15 was placed in an ice bath, 5 ml of acetic acid and 0.45 g of 18-crown-6-ether were added, and the whole was stirred. Next, 0.36 g of potassium permanganate was gradually added to the flask in the ice bath, and the whole was stirred in the ice bath for 2 hours and
20 stirred at room temperature for an additional 18 hours. After the completion of the reaction, 0.44 g

of a polymer was prepared in the same manner as in Example 23. NMR analysis was performed under the same conditions as those of Example 1 to determine the structure of the resultant polymer. The analysis confirmed that the polymer was a polyhydroxyalkanoate containing a unit represented by the following chemical formula (71) as a monomer unit.

The resultant polyhydroxyalkanoate was evaluated for average molecular weight in the same manner as in Example 1. As a result, the resultant polyhydroxyalkanoate was found to have a number average molecular weight M_n of 68,500 and a weight average molecular weight M_w of 112,000.

Furthermore, in order to calculate the unit of the resultant polyhydroxyalkanoate, 28 mg of the polyhydroxyalkanoate prepared in the same manner as in Example 24 was subjected to NMR analysis in the same manner as in Example 1. The analysis confirmed that the polyhydroxyalkanoate was a copolymer in which a C unit accounted for 9 mol% of the unit of the polyhydroxyalkanoate represented by the chemical

formula (71) and a D unit accounted for 91 mol% thereof.

(Example 40)

Oxidation reaction of polyhydroxyalkanoate
5 composed of unit represented by chemical formula (46)
synthesized in Example 18

0.50 g of the polyhydroxyalkanoate copolymer
composed of the unit represented by the chemical
10 formula (46) synthesized in Example 18 (A: 7 mol%, B:
93 mol%) was placed in a round-bottomed flask, and 30
ml of acetone was added to dissolve this. The flask
was placed in an ice bath, 5 ml of acetic acid and
0.42 g of 18-crown-6-ether were added, and the whole
15 was stirred. Next, 0.34 g of potassium permanganate
was gradually added to the flask in the ice bath, and
the whole was stirred in the ice bath for 2 hours and
stirred at room temperature for an additional 18
hours. After the completion of the reaction, 0.44 g
20 of a polymer was prepared in the same manner as in
Example 23. NMR analysis was performed under the

same conditions as those of Example 1 to determine the structure of the resultant polymer. The analysis confirmed that the polymer was a polyhydroxyalkanoate containing a unit represented by the following
5 chemical formula (72) as a monomer unit.

The resultant polyhydroxyalkanoate was evaluated for average molecular weight in the same manner as in Example 1. As a result, the resultant
10 polyhydroxyalkanoate was found to have a number average molecular weight M_n of 58,700 and a weight average molecular weight M_w of 95,700.

Furthermore, in order to calculate the unit of the resultant polyhydroxyalkanoate, 29 mg of the
15 polyhydroxyalkanoate prepared in the same manner as in Example 24 was subjected to NMR analysis in the same manner as in Example 1. The analysis confirmed that the polyhydroxyalkanoate was a copolymer in which a C unit accounted for 7 mol% of the unit of
20 the polyhydroxyalkanoate represented by the chemical formula (72) and a D unit accounted for 93 mol%

thereof.

(Example 41)

Oxidation reaction of polyhydroxyalkanoate
 composed of unit represented by chemical formula (48)
 5 synthesized in Example 19

0.50 g of the polyhydroxyalkanoate copolymer
 composed of the unit represented by the chemical
 formula (48) synthesized in Example 19 (A: 6 mol%, B:
 10 94 mol%) was placed in a round-bottomed flask, and 30
 ml of acetone was added to dissolve this. The flask
 was placed in an ice bath, 5 ml of acetic acid and
 0.30 g of 18-crown-6-ether were added, and the whole
 was stirred. Next, 0.24 g of potassium permanganate
 15 was gradually added to the flask in the ice bath, and
 the whole was stirred in the ice bath for 2 hours and
 stirred at room temperature for an additional 18
 hours. After the completion of the reaction, 0.45 g
 of a polymer was prepared in the same manner as in

Example 23. NMR analysis was performed under the same conditions as those of Example 1 to determine the structure of the resultant polymer. The analysis confirmed that the polymer was a polyhydroxyalkanoate containing a unit represented by the following chemical formula (73) as a monomer unit.

The resultant polyhydroxyalkanoate was evaluated for average molecular weight in the same manner as in Example 1. As a result, the resultant polyhydroxyalkanoate was found to have a number average molecular weight M_n of 72,600 and a weight average molecular weight M_w of 131,400.

Furthermore, in order to calculate the unit of the resultant polyhydroxyalkanoate, 28 mg of the polyhydroxyalkanoate prepared in the same manner as in Example 24 was subjected to NMR analysis in the same manner as in Example 1. The analysis confirmed that the polyhydroxyalkanoate was a copolymer in which a C unit accounted for 6 mol% of the unit of

the polyhydroxyalkanoate represented by the chemical formula (73) and a D unit accounted for 94 mol% thereof.

(Example 42)

- 5 Oxidation reaction of polyhydroxyalkanoate composed of unit represented by chemical formula (50) synthesized in Example 20

- 0.50 g of the polyhydroxyalkanoate copolymer composed of the unit represented by the chemical formula (50) synthesized in Example 20 (A: 4 mol%, B: 96 mol%) was placed in a round-bottomed flask, and 30 ml of acetone was added to dissolve this. The flask was placed in an ice bath, 5 ml of acetic acid and 0.20 g of 18-crown-6-ether were added, and the whole was stirred. Next, 0.16 g of potassium permanganate was gradually added to the flask in the ice bath, and
- 10
- 15

the whole was stirred in the ice bath for 2 hours and stirred at room temperature for an additional 18 hours. After the completion of the reaction, 0.43 g of a polymer was prepared in the same manner as in

5 Example 23. NMR analysis was performed under the same conditions as those of Example 1 to determine the structure of the resultant polymer. The analysis confirmed that the polymer was a polyhydroxyalkanoate containing a unit represented by the following

10 chemical formula (74) as a monomer unit.

The resultant polyhydroxyalkanoate was evaluated for average molecular weight in the same manner as in Example 1. As a result, the resultant

15 polyhydroxyalkanoate was found to have a number average molecular weight M_n of 48,700 and a weight average molecular weight M_w of 85,200.

Furthermore, in order to calculate the unit of the resultant polyhydroxyalkanoate, 29 mg of the polyhydroxyalkanoate prepared in the same manner as in Example 24 was subjected to NMR analysis in the same manner as in Example 1. The analysis confirmed that the polyhydroxyalkanoate was a copolymer in which a C unit accounted for 4 mol% of the unit of the polyhydroxyalkanoate represented by the chemical formula (74) and a D unit accounted for 96 mol% thereof.

(Example 43)

Oxidation reaction of polyhydroxyalkanoate composed of unit represented by chemical formula (52) synthesized in Example 21

15

0.50 g of the polyhydroxyalkanoate copolymer composed of the unit represented by the chemical formula (52) synthesized in Example 21 (A: 9 mol%, B: 91 mol%) was placed in a round-bottomed flask, and 30 ml of acetone was added to dissolve this. The flask was placed in an ice bath, 5 ml of acetic acid and

20

0.45 g of 18-crown-6-ether were added, and the whole was stirred. Next, 0.36 g of potassium permanganate was gradually added to the flask in the ice bath, and the whole was stirred in the ice bath for 2 hours and
 5 stirred at room temperature for an additional 18 hours. After the completion of the reaction, 0.44 g of a polymer was prepared in the same manner as in Example 23. NMR analysis was performed under the same conditions as those of Example 1 to determine
 10 the structure of the resultant polymer. The analysis confirmed that the polymer was a polyhydroxyalkanoate containing a unit represented by the following chemical formula (75) as a monomer unit.

15 The resultant polyhydroxyalkanoate was evaluated for average molecular weight in the same manner as in Example 1. As a result, the resultant polyhydroxyalkanoate was found to have a number average molecular weight M_n of 115,400 and a weight
 20 average molecular weight M_w of 202,000.

Furthermore, in order to calculate the unit of

the resultant polyhydroxyalkanoate, 28 mg of the polyhydroxyalkanoate prepared in the same manner as in Example 24 was subjected to NMR analysis in the same manner as in Example 1. The analysis confirmed
5 that the polyhydroxyalkanoate was a copolymer in which a C unit accounted for 9 mol% of the unit of the polyhydroxyalkanoate represented by the chemical formula (75) and a D unit accounted for 91 mol% thereof.

10 (Example 44)

Oxidation reaction of polyhydroxyalkanoate composed of unit represented by chemical formula (54) synthesized in Example 22

15 0.50 g of the polyhydroxyalkanoate copolymer composed of the unit represented by the chemical formula (54) synthesized in Example 22 (A: 7 mol%, B: 93 mol%) was placed in a round-bottomed flask, and 30 ml of acetone was added to dissolve this. The flask
20 was placed in an ice bath, 5 ml of acetic acid and 0.42 g of 18-crown-6-ether were added, and the whole

was stirred. Next, 0.34 g of potassium permanganate was gradually added to the flask in the ice bath, and the whole was stirred in the ice bath for 2 hours and stirred at room temperature for an additional 18
 5 hours. After the completion of the reaction, 0.44 g of a polymer was prepared in the same manner as in Example 23. NMR analysis was performed under the same conditions as those of Example 1 to determine the structure of the resultant polymer. The analysis
 10 confirmed that the polymer was a polyhydroxyalkanoate containing a unit represented by the following chemical formula (76) as a monomer unit.

The resultant polyhydroxyalkanoate was
 15 evaluated for average molecular weight in the same manner as in Example 1. As a result, the resultant polyhydroxyalkanoate was found to have a number average molecular weight M_n of 106,800 and a weight average molecular weight M_w of 174,100.
 20 Furthermore, in order to calculate the unit of the resultant polyhydroxyalkanoate, 27 mg of the

polyhydroxyalkanoate prepared in the same manner as in Example 24 was subjected to NMR analysis in the same manner as in Example 1. The analysis confirmed that the polyhydroxyalkanoate was a copolymer in which a C unit accounted for 7 mol% of the unit of the polyhydroxyalkanoate represented by the chemical formula (76) and a D unit accounted for 93 mol% thereof.

(Example 45)

Condensation reaction between polyhydroxyalkanoate composed of unit represented by chemical formula (56) synthesized in Example 24 and 2-aminobenzenesulfonic acid

Under a nitrogen atmosphere, 0.40 g of the polymer synthesized by using the polyhydroxyalkanoate copolymer composed of the unit represented by the chemical formula (56) synthesized in Example 24 (C: 9 mol%, D: 91 mol%) and 0.40 g of 2-aminobenzenesulfonic acid were placed in a 100-ml three-necked flask. 15.0 ml of pyridine was added to

the flask, and the mixture was stirred. After that, 1.21 ml of triphenyl phosphite were added, and the whole was heated at 120°C for 6 hours. After the completion of the reaction, the resultant was

5 reprecipitated in 150 ml of ethanol, followed by collection. The resultant polymer was washed with 1N hydrochloric acid for 1 day, stirred in water for 1 day to wash the polymer, and dried under reduced pressure to prepare 0.34 g of a polymer. The

10 structure of the resultant polymer was determined through analysis according to ^1H -NMR (FT-NMR: Bruker DPX 400; resonance frequency: 400 MHz; measured nuclear species: ^1H ; solvent used: DMSO- d_6 ; measurement temperature: room temperature) or Fourier

15 transformation-infrared absorption (FT-IR) spectrum (Nicolet AVATAR 360FT-IR). As a result of IR measurement, a peak at $1,695\text{ cm}^{-1}$ derived from a carboxylic acid reduced, and a peak derived from an amide group was newly observed at $1,658\text{ cm}^{-1}$.

20 ^1H -NMR confirmed that the resultant polymer was a polyhydroxyalkanoate containing a unit represented by the following chemical formula (77) as a monomer unit because a peak derived from an aromatic ring of the 2-aminobenzenesulfonic acid structure shifted.

It was also confirmed that the polyhydroxyalkanoate was a copolymer in which an E unit accounted for 9 mol% of the unit of the polyhydroxyalkanoate represented by the chemical formula (77) and an F unit accounted for 91 mol% thereof. The resultant polymer was evaluated for average molecular weight by means of gel permeation chromatography (GPC; Tosoh Corporation HLC-8120, column; Polymer Laboratories PLgel 5 μ MIXED-C, solvent; DMF/LiBr 0.1% (w/v), polystyrene conversion).

As a result, the resultant polymer was found to have a number average molecular weight M_n of 19,800 and a weight average molecular weight M_w of 28,100.

(Example 46)

Condensation reaction between polyhydroxyalkanoate composed of unit represented by chemical formula (57) synthesized in Example 25 and 2-amino-2-methylpropanesulfonic acid

Under a nitrogen atmosphere, 0.40 g of the polymer synthesized by using the polyhydroxyalkanoate copolymer composed of the unit represented by the chemical formula (57) synthesized in Example 25 (C: 10 mol%, D: 90 mol%) and 0.23 g of 2-amino-2-methylpropanesulfonic acid were placed in a 100-ml three-necked flask. 15.0 ml of pyridine were added to the flask, and the mixture was stirred. After that, 0.78 ml of triphenyl phosphite was added, and the whole was heated at 120°C for 6 hours. After the completion of the reaction, 0.32 g of a polymer was prepared in the same manner as in Example 45. The structure of the resultant polymer was determined through analysis in the same manner as in Example 45. As a result of IR measurement, a peak at 1,695 cm⁻¹ derived from a carboxylic acid reduced, and a peak derived from an amide group was newly observed at 1,668 cm⁻¹.

¹H-NMR confirmed that the resultant polymer was a polyhydroxyalkanoate containing a unit represented by the following chemical formula (78) as a monomer

unit because a peak derived from methylene of the 2-amino-2-methylpropanesulfonic acid structure shifted.

It was also confirmed that the polyhydroxyalkanoate was a copolymer in which an E unit accounted for 10 mol% of the unit of the polyhydroxyalkanoate represented by the chemical formula (78) and an F unit accounted for 90 mol% thereof. The resultant polymer was evaluated for average molecular weight in the same manner as in Example 45. As a result, the resultant polymer was found to have a number average molecular weight M_n of 17,600 and a weight average molecular weight M_w of 27,100.

(Example 47)

Condensation reaction between
polyhydroxyalkanoate composed of unit represented by
chemical formula (58) synthesized in Example 26 and
2-aminobenzenesulfonic acid phenyl ester

- Under a nitrogen atmosphere, 0.40 g of the polymer synthesized by using the polyhydroxyalkanoate copolymer composed of the unit represented by the chemical formula (58) synthesized in Example 26 (C: 5 15 mol%, D: 85 mol%) and 0.71 g of 2-aminobenzenesulfonic acid phenyl ester were placed in a 100-ml three-necked flask. 15.0 ml of pyridine was added to the flask, and the mixture was stirred.
- 10 After that, 1.50 ml of triphenyl phosphite was added, and the whole was heated at 120°C for 6 hours. After the completion of the reaction, 0.37 g of a polymer was prepared in the same manner as in Example 45.
- The structure of the resultant polymer was determined 15 through analysis in the same manner as in Example 45. As a result of IR measurement, a peak at 1,695 cm⁻¹ derived from a carboxylic acid reduced, and a peak derived from an amide group was newly observed at 1,658 cm⁻¹.
- 20 ¹H-NMR confirmed that the resultant polymer was a polyhydroxyalkanoate containing a unit represented by the following chemical formula (79) as a monomer unit because a peak derived from an aromatic ring of

the 2-aminobenzenesulfonic acid phenyl ester structure shifted.

It was also confirmed that the

5 polyhydroxyalkanoate was a copolymer in which an E unit accounted for 15 mol% of the unit of the polyhydroxyalkanoate represented by the chemical formula (79) and an F unit accounted for 85 mol% thereof. The resultant polymer was evaluated for

10 average molecular weight in the same manner as in Example 45. As a result, the resultant polymer was found to have a number average molecular weight M_n of 14,000 and a weight average molecular weight M_w of 22,000.

15 (Example 48)

Condensation reaction between polyhydroxyalkanoate composed of unit represented by chemical formula (59) synthesized in Example 27 and 2-amino-1-naphthalenesulfonic acid

Under a nitrogen atmosphere, 0.40 g of the polymer synthesized by using the polyhydroxyalkanoate copolymer composed of the unit represented by the chemical formula (59) synthesized in Example 27 (C: 8 mol%, D: 92 mol%) and 0.46 g of 2-amino-1-naphthalenesulfonic acid were placed in a 100-ml three-necked flask. 15.0 ml of pyridine was added to the flask, and the mixture was stirred. After that, 1.07 ml of triphenyl phosphite was added, and the whole was heated at 120°C for 6 hours. After the completion of the reaction, 0.36 g of a polymer was prepared in the same manner as in Example 45. The structure of the resultant polymer was determined through analysis in the same manner as in Example 45. As a result of IR measurement, a peak at 1,695 cm⁻¹ derived from a carboxylic acid reduced, and a peak derived from an amide group was newly observed at 1,658 cm⁻¹. ¹H-NMR confirmed that the resultant polymer was a polyhydroxyalkanoate containing a unit represented by the following chemical formula (80) as a monomer unit because a peak derived from an

aromatic ring of the 2-amino-1-naphthalenesulfonic acid structure shifted.

It was also confirmed that the

5 polyhydroxyalkanoate was a copolymer in which an E unit accounted for 8 mol% of the unit of the polyhydroxyalkanoate represented by the chemical formula (80) and an F unit accounted for 92 mol% thereof. The resultant polymer was evaluated for

10 average molecular weight in the same manner as in Example 45. As a result, the resultant polymer was found to have a number average molecular weight M_n of 17,800 and a weight average molecular weight M_w of 28,100.

15 (Example 49)

Condensation reaction between polyhydroxyalkanoate composed of unit represented by chemical formula (60) synthesized in Example 28 and

p-toluidine-2-sulfonic acid

Under a nitrogen atmosphere, 0.40 g of the polymer synthesized by using the polyhydroxyalkanoate

5 copolymer composed of the unit represented by the chemical formula (60) synthesized in Example 28 (C: 7 mol%, D: 93 mol%) and 0.33 g of p-toluidine-2-sulfonic acid were placed in a 100-ml three-necked flask. 15.0 ml of pyridine was added to the flask,

10 and the mixture was stirred. After that, 0.92 ml of triphenyl phosphite was added, and the whole was heated at 120°C for 6 hours. After the completion of the reaction, 0.33 g of a polymer was prepared in the same manner as in Example 45. The structure of the

15 resultant polymer was determined through analysis in the same manner as in Example 45. As a result of IR measurement, a peak at 1,695 cm^{-1} derived from a carboxylic acid reduced, and a peak derived from an amide group was newly observed at 1,658 cm^{-1} . $^1\text{H-NMR}$

20 confirmed that the resultant polymer was a polyhydroxyalkanoate containing a unit represented by

the following chemical formula (81) as a monomer unit because a peak derived from an aromatic ring of the p-toluidine-2-sulfonic acid structure shifted.

5 It was also confirmed that the polyhydroxyalkanoate was a copolymer in which an E unit accounted for 7 mol% of the unit of the polyhydroxyalkanoate represented by the chemical formula (81) and an F unit accounted for 93 mol% thereof. The resultant polymer was evaluated for average molecular weight in the same manner as in Example 45. As a result, the resultant polymer was found to have a number average molecular weight Mn of 12,100 and a weight average molecular weight Mw of 19,400.

15 (Example 50)

Condensation reaction between

polyhydroxyalkanoate composed of unit represented by chemical formula (61) synthesized in Example 29 and 4-methoxyaniline-2-sulfonic acid

5 Under a nitrogen atmosphere, 0.40 g of the polymer synthesized by using the polyhydroxyalkanoate copolymer composed of the unit represented by the chemical formula (61) synthesized in Example 29 (C: 4 mol%, D: 96 mol%) and 0.21 g of 4-methoxyaniline-2-sulfonic acid were placed in a 100-ml three-necked flask. 15.0 ml of pyridine was added to the flask, and the mixture was stirred. After that, 0.53 ml of triphenyl phosphite was added, and the whole was heated at 120°C for 6 hours. After the completion of the reaction, 0.34 g of a polymer was prepared in the same manner as in Example 45. The structure of the resultant polymer was determined through analysis in the same manner as in Example 45. As a result of IR

measurement, a peak at $1,695\text{ cm}^{-1}$ derived from a carboxylic acid reduced, and a peak derived from an amide group was newly observed at $1,658\text{ cm}^{-1}$. $^1\text{H-NMR}$ confirmed that the resultant polymer was a

5 polyhydroxyalkanoate containing a unit represented by the following chemical formula (82) as a monomer unit because a peak derived from an aromatic ring of the 4-methoxyaniline-2-sulfonic acid structure shifted.

10 It was also confirmed that the polyhydroxyalkanoate was a copolymer in which an E unit accounted for 4 mol% of the unit of the polyhydroxyalkanoate represented by the chemical formula (82) and an F unit accounted for 96 mol%

thereof. The resultant polymer was evaluated for average molecular weight in the same manner as in Example 45. As a result, the resultant polymer was found to have a number average molecular weight M_n of 11,900 and a weight average molecular weight M_w of 18,800.

(Example 51)

Condensation reaction between polyhydroxyalkanoate composed of unit represented by chemical formula (62) synthesized in Example 30 and 2-aminobenzenesulfonic acid

Under a nitrogen atmosphere, 0.40 g of the polymer synthesized by using the polyhydroxyalkanoate copolymer composed of the unit represented by the chemical formula (62) synthesized in Example 24 (C: 5 mol%, D: 95 mol%) and 0.23 g of 2-aminobenzenesulfonic acid were placed in a 100-ml three-necked flask. 15.0 ml of pyridine was added to the flask, and the mixture was stirred. After that, 0.69 ml of triphenyl phosphite was added, and the whole was heated at 120°C for 6 hours. After the

completion of the reaction, 0.33 g of a polymer was prepared in the same manner as in Example 45. The structure of the resultant polymer was determined through analysis in the same manner as in Example 45.

- 5 As a result of IR measurement, a peak at $1,695\text{ cm}^{-1}$ derived from a carboxylic acid reduced, and a peak derived from an amide group was newly observed at $1,658\text{ cm}^{-1}$. $^1\text{H-NMR}$ confirmed that the resultant polymer was a polyhydroxyalkanoate containing a unit represented by the following chemical formula (83) as
10 a monomer unit because a peak derived from an aromatic ring of the 2-aminobenzenesulfonic acid structure shifted.

- 15 It was also confirmed that the polyhydroxyalkanoate was a copolymer in which an E unit accounted for 5 mol% of the unit of the polyhydroxyalkanoate represented by the chemical formula (83) and an F unit accounted for 95 mol%
20 thereof. The resultant polymer was evaluated for average molecular weight in the same manner as in

Example 45. As a result, the resultant polymer was found to have a number average molecular weight M_n of 7,300 and a weight average molecular weight M_w of 11,600.

5 (Example 52)

Condensation reaction between polyhydroxyalkanoate composed of unit represented by chemical formula (63) synthesized in Example 31 and taurine

10

Under a nitrogen atmosphere, 0.40 g of the polymer synthesized by using the polyhydroxyalkanoate copolymer composed of the unit represented by the chemical formula (63) synthesized in Example 31 (C: 6
 15 mol%, D: 94 mol%) and 0.11 g of taurine were placed in a 100-ml three-necked flask. 15.0 ml of pyridine were added to the flask, and the mixture was stirred. After that, 0.46 ml of triphenyl phosphite was added, and the whole was heated at 120°C for 6 hours. After
 20 the completion of the reaction, 0.30 g of a polymer was prepared in the same manner as in Example 45.

The structure of the resultant polymer was determined through analysis in the same manner as in Example 45. As a result of IR measurement, a peak at $1,695\text{ cm}^{-1}$ derived from a carboxylic acid reduced, and a peak
5 derived from an amide group was newly observed at $1,668\text{ cm}^{-1}$.

$^1\text{H-NMR}$ confirmed that the resultant polymer was a polyhydroxyalkanoate containing a unit represented by the following chemical formula (84) as a monomer,
10 unit because a peak derived from methylene of the taurine structure shifted.

It was also confirmed that the polyhydroxyalkanoate was a copolymer in which an E
15 unit accounted for 6 mol% of the unit of the polyhydroxyalkanoate represented by the chemical formula (84) and an F unit accounted for 94 mol% thereof. The resultant polymer was evaluated for average molecular weight in the same manner as in

Example 45. As a result, the resultant polymer was found to have a number average molecular weight M_n of 6,800 and a weight average molecular weight M_w of 10,900.

5 (Example 53)

Condensation reaction between polyhydroxyalkanoate composed of unit represented by chemical formula (64) synthesized in Example 32 and 1-naphthylamine-8-sulfonic acid

10

Under a nitrogen atmosphere, 0.40 g of the polymer synthesized by using the polyhydroxyalkanoate copolymer composed of the unit represented by the chemical formula (64) synthesized in Example 32 (C: 4 mol%, D: 96 mol%) and 0.24 g of 1-naphthylamine-8-sulfonic acid were placed in a 100-ml three-necked flask. 15.0 ml of pyridine was added to the flask, and the mixture was stirred. After that, 0.55 ml of triphenyl phosphite was added, and the whole was heated at 120°C for 6 hours. After the completion of the reaction, 0.35 g of a polymer was prepared in the same manner as in Example 45. The structure of the

15

20

resultant polymer was determined through analysis in the same manner as in Example 45. As a result of IR measurement, a peak at $1,695\text{ cm}^{-1}$ derived from a carboxylic acid reduced, and a peak derived from an amide group was newly observed at $1,658\text{ cm}^{-1}$. $^1\text{H-NMR}$ confirmed that the resultant polymer was a polyhydroxyalkanoate containing a unit represented by the following chemical formula (85) as a monomer unit because a peak derived from an aromatic ring of the 1-naphthylamine-8-sulfonic acid structure shifted.

It was also confirmed that the polyhydroxyalkanoate was a copolymer in which an E unit accounted for 4 mol% of the unit of the polyhydroxyalkanoate represented by the chemical formula (85) and an F unit accounted for 96 mol% thereof. The resultant polymer was evaluated for average molecular weight in the same manner as in Example 45. As a result, the resultant polymer was

found to have a number average molecular weight M_n of 5,300 and a weight average molecular weight M_w of 9,000.

(Example 54)

- 5 Condensation reaction between
polyhydroxyalkanoate composed of unit represented by
chemical formula (65) synthesized in Example 33 and
4-aminobenzenesulfonic acid phenyl ester

- 10 Under a nitrogen atmosphere, 0.40 g of the
polymer synthesized by using the polyhydroxyalkanoate
copolymer composed of the unit represented by the
chemical formula (65) synthesized in Example 33 (C: 4
mol%, D: 96 mol%) and 0.25 g of 4-
15 aminobenzenesulfonic acid phenyl ester were placed in
a 100-ml three-necked flask. 15.0 ml of pyridine was
added to the flask, and the mixture was stirred.
After that, 0.53 ml of triphenyl phosphite was added,
and the whole was heated at 120°C for 6 hours. After
20 the completion of the reaction, 0.35 g of a polymer
was prepared in the same manner as in Example 45.

The structure of the resultant polymer was determined through analysis in the same manner as in Example 45. As a result of IR measurement, a peak at $1,695\text{ cm}^{-1}$ derived from a carboxylic acid reduced, and a peak
 5 derived from an amide group was newly observed at $1,658\text{ cm}^{-1}$.

$^1\text{H-NMR}$ confirmed that the resultant polymer was a polyhydroxyalkanoate containing a unit represented by the following chemical formula (86) as a monomer
 10 unit because a peak derived from an aromatic ring of the 4-aminobenzenesulfonic acid phenyl ester structure shifted.

It was also confirmed that the
 15 polyhydroxyalkanoate was a copolymer in which an E unit accounted for 4 mol% of the unit of the

polyhydroxyalkanoate represented by the chemical formula (86) and an F unit accounted for 96 mol% thereof. The resultant polymer was evaluated for average molecular weight in the same manner as in

5 Example 45. As a result, the resultant polymer was found to have a number average molecular weight M_n of 5,200 and a weight average molecular weight M_w of 8,000.

(Example 55)

10 Condensation reaction between polyhydroxyalkanoate composed of unit represented by chemical formula (68) synthesized in Example 36 and 2-aminobenzenesulfonic acid

15 Under a nitrogen atmosphere, 0.40 g of the polymer synthesized by using the polyhydroxyalkanoate copolymer composed of the unit represented by the chemical formula (68) synthesized in Example 36 (C: 10 mol%, D: 90 mol%) and 0.43 g of 2-

20 aminobenzenesulfonic acid were placed in a 100-ml three-necked flask. 15.0 ml of pyridine was added to the flask, and the mixture was stirred. After that,

1.29 ml of triphenyl phosphite was added, and the whole was heated at 120°C for 6 hours. After the completion of the reaction, 0.34 g of a polymer was prepared in the same manner as in Example 45. The structure of the resultant polymer was determined through analysis in the same manner as in Example 45. As a result of IR measurement, a peak at 1,695 cm⁻¹ derived from a carboxylic acid reduced, and a peak derived from an amide group was newly observed at 1,658 cm⁻¹. ¹H-NMR confirmed that the resultant polymer was a polyhydroxyalkanoate containing a unit represented by the following chemical formula (87) as a monomer unit because a peak derived from an aromatic ring of the 2-aminobenzenesulfonic acid structure shifted.

It was also confirmed that the polyhydroxyalkanoate was a copolymer in which an E unit accounted for 10 mol% of the unit of the

polyhydroxyalkanoate represented by the chemical formula (87) and an F unit accounted for 90 mol% thereof. The resultant polymer was evaluated for average molecular weight in the same manner as in

5 Example 45. As a result, the resultant polymer was found to have a number average molecular weight M_n of 109,800 and a weight average molecular weight M_w of 184,500.

(Example 56)

10 Condensation reaction between polyhydroxyalkanoate composed of unit represented by chemical formula (68) synthesized in Example 36 and 2-amino-2-methylpropanesulfonic acid

15 Under a nitrogen atmosphere, 0.40 g of the polymer synthesized by using the polyhydroxyalkanoate copolymer composed of the unit represented by the chemical formula (68) synthesized in Example 36 (C: 10 mol%, D: 90 mol%) and 0.38 g of 2-amino-2-

20 methylpropanesulfonic acid were placed in a 100-ml three-necked flask. 15.0 ml of pyridine was added to the flask, and the mixture was stirred. After that,

1.29 ml of triphenyl phosphite was added, and the whole was heated at 120°C for 6 hours. After the completion of the reaction, 0.34 g of a polymer was prepared in the same manner as in Example 45. The structure of the resultant polymer was determined through analysis in the same manner as in Example 45. As a result of IR measurement, a peak at 1,695 cm^{-1} derived from a carboxylic acid reduced, and a peak derived from an amide group was newly observed at 1,668 cm^{-1} .

¹H-NMR confirmed that the resultant polymer was a polyhydroxyalkanoate containing a unit represented by the following chemical formula (88) as a monomer unit because a peak derived from methylene of the 2-amino-2-methylpropanesulfonic acid structure shifted.

It was also confirmed that the polyhydroxyalkanoate was a copolymer in which an E unit accounted for 10 mol% of the unit of the polyhydroxyalkanoate represented by the chemical

formula (88) and an F unit accounted for 90 mol% thereof. The resultant polymer was evaluated for average molecular weight in the same manner as in Example 45. As a result, the resultant polymer was
 5 found to have a number average molecular weight M_n of 105,300 and a weight average molecular weight M_w of 181,100.

(Example 57)

Condensation reaction between
 10 polyhydroxyalkanoate composed of unit represented by chemical formula (68) synthesized in Example 36 and 2-aminobenzenesulfonic acid phenyl ester

Under a nitrogen atmosphere, 0.40 g of the
 15 polymer synthesized by using the polyhydroxyalkanoate copolymer composed of the unit represented by the chemical formula (68) synthesized in Example 36 (C: 10 mol%, D: 90 mol%) and 0.62 g of 2-aminobenzenesulfonic acid phenyl ester were placed in
 20 a 100-ml three-necked flask. 15.0 ml of pyridine was added to the flask, and the mixture was stirred. After that, 1.29 ml of triphenyl phosphite was added,

and the whole was heated at 120°C for 6 hours. After the completion of the reaction, 0.37 g of a polymer was prepared in the same manner as in Example 45.

The structure of the resultant polymer was determined through analysis in the same manner as in Example 45. As a result of IR measurement, a peak at 1,695 cm⁻¹ derived from a carboxylic acid reduced, and a peak derived from an amide group was newly observed at 1,658 cm⁻¹.

¹H-NMR confirmed that the resultant polymer was a polyhydroxyalkanoate containing a unit represented by the following chemical formula (89) as a monomer unit because a peak derived from an aromatic ring of the 2-aminobenzenesulfonic acid phenyl ester structure shifted.

It was also confirmed that the polyhydroxyalkanoate was a copolymer in which an E unit accounted for 10 mol% of the unit of the

polyhydroxyalkanoate represented by the chemical formula (89) and an F unit accounted for 90 mol% thereof. The resultant polymer was evaluated for average molecular weight in the same manner as in

5 Example 45. As a result, the resultant polymer was found to have a number average molecular weight M_n of 113,000 and a weight average molecular weight M_w of 200,000.

(Example 58)

10 Condensation reaction between polyhydroxyalkanoate composed of unit represented by chemical formula (68) synthesized in Example 36 and 2-amino-1-naphthalenesulfonic acid

15 Under a nitrogen atmosphere, 0.40 g of the polymer synthesized by using the polyhydroxyalkanoate copolymer composed of the unit represented by the chemical formula (68) synthesized in Example 36 (C: 10 mol%, D: 90 mol%) and 0.55 g of 2-amino-1-

20 naphthalenesulfonic acid were placed in a 100-ml three-necked flask. 15.0 ml of pyridine was added to the flask, and the mixture was stirred. After that,

1.29 ml of triphenyl phosphite was added, and the whole was heated at 120°C for 6 hours. After the completion of the reaction, 0.36 g of a polymer was prepared in the same manner as in Example 45. The
5 structure of the resultant polymer was determined through analysis in the same manner as in Example 45. As a result of IR measurement, a peak at 1,695 cm⁻¹ derived from a carboxylic acid reduced, and a peak derived from an amide group was newly observed at
10 1,658 cm⁻¹. ¹H-NMR confirmed that the resultant polymer was a polyhydroxyalkanoate containing a unit represented by the following chemical formula (90) as a monomer unit because a peak derived from an aromatic ring of the 2-amino-1-naphthalenesulfonic
15 acid structure shifted.

It was also confirmed that the polyhydroxyalkanoate was a copolymer in which an E unit accounted for 10 mol% of the unit of the

polyhydroxyalkanoate represented by the chemical formula (90) and an F unit accounted for 90 mol% thereof. The resultant polymer was evaluated for average molecular weight in the same manner as in

5 Example 45. As a result, the resultant polymer was found to have a number average molecular weight M_n of 111,400 and a weight average molecular weight M_w of 187,200.

(Example 59)

10 Condensation reaction between polyhydroxyalkanoate composed of unit represented by chemical formula (69) synthesized in Example 37 and 3-aminobenzenesulfonic acid

15 Under a nitrogen atmosphere, 0.40 g of the polymer synthesized by using the polyhydroxyalkanoate copolymer composed of the unit represented by the chemical formula (69) synthesized in Example 37 (C: 11 mol%, D: 89 mol%) and 0.28 g of 3-

20 aminobenzenesulfonic acid were placed in a 100-ml three-necked flask. 15.0 ml of pyridine was added to

the flask, and the mixture was stirred. After that, 0.84 ml of triphenyl phosphite was added, and the whole was heated at 120°C for 6 hours. After the completion of the reaction, 0.33 g of a polymer was prepared in the same manner as in Example 45. The structure of the resultant polymer was determined through analysis in the same manner as in Example 45. As a result of IR measurement, a peak at 1,695 cm⁻¹ derived from a carboxylic acid reduced, and a peak derived from an amide group was newly observed at 1,658 cm⁻¹. ¹H-NMR confirmed that the resultant polymer was a polyhydroxyalkanoate containing a unit represented by the following chemical formula (91) as a monomer unit because a peak derived from an aromatic ring of the 3-aminobenzenesulfonic acid structure shifted.

It was also confirmed that the polyhydroxyalkanoate was a copolymer in which an E

unit accounted for 11 mol% of the unit of the polyhydroxyalkanoate represented by the chemical formula (91) and an F unit accounted for 89 mol% thereof. The resultant polymer was evaluated for average molecular weight in the same manner as in Example 45. As a result, the resultant polymer was found to have a number average molecular weight M_n of 32,600 and a weight average molecular weight M_w of 59,000.

10 (Example 60)

Condensation reaction between polyhydroxyalkanoate composed of unit represented by chemical formula (70) synthesized in Example 38 and taurine

15

Under a nitrogen atmosphere, 0.40 g of the polymer synthesized by using the polyhydroxyalkanoate copolymer composed of the unit represented by the chemical formula (70) synthesized in Example 38 (C: 16 mol%, D: 84 mol%) and 0.45 g of taurine were placed in a 100-ml three-necked flask. 15.0 ml of

20

pyridine was added to the flask, and the mixture was stirred. After that, 1.89 ml of triphenyl phosphite was added, and the whole was heated at 120°C for 6 hours. After the completion of the reaction, 0.32 g of a polymer was prepared in the same manner as in Example 45. The structure of the resultant polymer was determined through analysis in the same manner as in Example 45. As a result of IR measurement, a peak at 1,695 cm^{-1} derived from a carboxylic acid reduced, and a peak derived from an amide group was newly observed at 1,668 cm^{-1} .

^1H -NMR confirmed that the resultant polymer was a polyhydroxyalkanoate containing a unit represented by the following chemical formula (92) as a monomer unit because a peak derived from a methylene of the taurine structure shifted.

It was also confirmed that the polyhydroxyalkanoate was a copolymer in which an E

unit accounted for 16 mol% of the unit of the polyhydroxyalkanoate represented by the chemical formula (92) and an F unit accounted for 84 mol% thereof. The resultant polymer was evaluated for average molecular weight in the same manner as in Example 45. As a result, the resultant polymer was found to have a number average molecular weight M_n of 28,700 and a weight average molecular weight M_w of 51,100.

(Example 61)

Condensation reaction between polyhydroxyalkanoate composed of unit represented by chemical formula (72) synthesized in Example 40 and 4-methoxyaniline-2-sulfonic acid

15

Under a nitrogen atmosphere, 0.40 g of the polymer synthesized by using the polyhydroxyalkanoate copolymer composed of the unit represented by the chemical formula (72) synthesized in Example 40 (C: 7 mol%, D: 93 mol%) and 0.42 g of 4-methoxyaniline-2-sulfonic acid were placed in a 100-ml three-necked

20

flask. 15.0 ml of pyridine was added to the flask, and the mixture was stirred. After that, 1.09 ml of triphenyl phosphite was added, and the whole was heated at 120°C for 6 hours. After the completion of the reaction, 0.32 g of a polymer was prepared in the same manner as in Example 45. The structure of the resultant polymer was determined through analysis in the same manner as in Example 45. As a result of IR measurement, a peak at 1,695 cm^{-1} derived from a carboxylic acid reduced, and a peak derived from an amide group was newly observed at 1,658 cm^{-1} . $^1\text{H-NMR}$ confirmed that the resultant polymer was a polyhydroxyalkanoate containing a unit represented by the following chemical formula (93) as a monomer unit because a peak derived from an aromatic ring of the 4-methoxyaniline-2-sulfonic acid structure shifted.

It was also confirmed that the polyhydroxyalkanoate was a copolymer in which an E unit accounted for 6 mol% of the unit of the polyhydroxyalkanoate represented by the chemical formula (93) and an F unit accounted for 94 mol% thereof. The resultant polymer was evaluated for average molecular weight in the same manner as in Example 45. As a result, the resultant polymer was found to have a number average molecular weight M_n of 47,800 and a weight average molecular weight M_w of 80,800.

(Example 62)

Condensation reaction between polyhydroxyalkanoate composed of unit represented by chemical formula (74) synthesized in Example 42 and 2-aminobenzenesulfonic acid

Under a nitrogen atmosphere, 0.40 g of the

polymer synthesized by using the polyhydroxyalkanoate copolymer composed of the unit represented by the chemical formula (74) synthesized in Example 40 (C: 4 mol%, D: 96 mol%) and 0.17 g of 2-aminobenzenesulfonic acid were placed in a 100-ml three-necked flask. 15.0 ml of pyridine was added to the flask, and the mixture was stirred. After that, 0.53 ml of triphenyl phosphite was added, and the whole was heated at 120°C for 6 hours. After the completion of the reaction, 0.31 g of a polymer was prepared in the same manner as in Example 45. The structure of the resultant polymer was determined through analysis in the same manner as in Example 45. As a result of IR measurement, a peak at 1,695 cm^{-1} derived from a carboxylic acid reduced, and a peak derived from an amide group was newly observed at 1,658 cm^{-1} . ^1H -NMR confirmed that the resultant polymer was a polyhydroxyalkanoate containing a unit represented by the following chemical formula (94) as a monomer unit because a peak derived from an aromatic ring of the 2-aminobenzenesulfonic acid structure shifted.

It was also confirmed that the polyhydroxyalkanoate was a copolymer in which an E unit accounted for 4 mol% of the unit of the polyhydroxyalkanoate represented by the chemical formula (94) and an F unit accounted for 96 mol% thereof. The resultant polymer was evaluated for average molecular weight in the same manner as in Example 45. As a result, the resultant polymer was found to have a number average molecular weight Mn of 42,800 and a weight average molecular weight Mw of 77,500.

(Example 63)

Condensation reaction between polyhydroxyalkanoate composed of unit represented by

chemical formula (75) synthesized in Example 43 and p-toluidine-2-sulfonic acid

Under a nitrogen atmosphere, 0.40 g of the

5 polymer synthesized by using the polyhydroxyalkanoate copolymer composed of the unit represented by the chemical formula (75) synthesized in Example 43 (C: 9 mol%, D: 91 mol%) and 0.41 g of p-toluidine-2-sulfonic acid were placed in a 100-ml three-necked

10 flask. 15.0 ml of pyridine was added to the flask, and the mixture was stirred. After that, 1.16 ml of triphenyl phosphite was added, and the whole was heated at 120°C for 6 hours. After the completion of the reaction, 0.36 g of a polymer was prepared in the

15 same manner as in Example 45. The structure of the resultant polymer was determined through analysis in the same manner as in Example 45. As a result of IR measurement, a peak at 1,695 cm⁻¹ derived from a carboxylic acid reduced, and a peak derived from an

20 amide group was newly observed at 1,658 cm⁻¹. ¹H-NMR confirmed that the resultant polymer was a polyhydroxyalkanoate containing a unit represented by

the following chemical formula (95) as a monomer unit because a peak derived from an aromatic ring of the p-toluidine-2-sulfonic acid structure shifted.

5 It was also confirmed that the polyhydroxyalkanoate was a copolymer in which an E unit accounted for 9 mol% of the unit of the polyhydroxyalkanoate represented by the chemical formula (95) and an F unit accounted for 91 mol% thereof. The resultant polymer was evaluated for average molecular weight in the same manner as in Example 45. As a result, the resultant polymer was found to have a number average molecular weight Mn of 98,500 and a weight average molecular weight Mw of 176,300.

10

15

(Example 64)

Condensation reaction between polyhydroxyalkanoate composed of unit represented by

chemical formula (76) synthesized in Example 44 and
2-amino-2-methylpropanesulfonic acid

Under a nitrogen atmosphere, 0.40 g of the
5 polymer synthesized by using the polyhydroxyalkanoate
copolymer composed of the unit represented by the
chemical formula (76) synthesized in Example 44 (C: 7
mol%, D: 93 mol%) and 0.32 g of 2-amino-2-
methylpropanesulfonic acid were placed in a 100-ml
10 three-necked flask. 15.0 ml of pyridine was added to
the flask, and the mixture was stirred. After that,
1.09 ml of triphenyl phosphite was added, and the
whole was heated at 120°C for 6 hours. After the
completion of the reaction, 0.36 g of a polymer was
15 prepared in the same manner as in Example 45. The
structure of the resultant polymer was determined
through analysis in the same manner as in Example 45.
As a result of IR measurement, a peak at 1,695 cm⁻¹
derived from a carboxylic acid reduced, and a peak
20 derived from an amide group was newly observed at
1,668 cm⁻¹. ¹H-NMR confirmed that the resultant

polymer was a polyhydroxyalkanoate containing a unit represented by the following chemical formula (96) as a monomer unit because a peak derived from methylene of the 2-amino-2-methylpropanesulfonic acid structure
 5 shifted.

It was also confirmed that the polyhydroxyalkanoate was a copolymer in which an E unit accounted for 7 mol% of the unit of the polyhydroxyalkanoate represented by the chemical
 10 formula (96) and an F unit accounted for 93 mol% thereof. The resultant polymer was evaluated for average molecular weight in the same manner as in Example 45. As a result, the resultant polymer was
 15 found to have a number average molecular weight M_n of 106,800 and a weight average molecular weight M_w of 174,000.

(Example 65)

Esterification reaction of polyhydroxyalkanoate

composed of unit represented by chemical formula (77)
synthesized in Example 45

0.30 g of the polyhydroxyalkanoate copolymer
5 composed of the unit represented by the chemical
formula (77) synthesized in Example 45 (E: 9 mol%, F:
91 mol%) was added to a round-bottomed flask. Then,
21.0 ml of chloroform and 7.0 ml of methanol were
added to dissolve the polymer, and the solution was
10 cooled to 0°C. 1.48 ml of a 2-mol/L
trimethylsilyldiazomethane-hexane solution
(manufactured by Aldrich) were added to the solution,
and the whole was stirred for 4 hours. After the
completion of the reaction, the solvent was distilled
15 off by using an evaporator, and then the polymer was
collected.

Furthermore, 21.0 ml of chloroform and 7.0 ml
of methanol were added to dissolve the polymer again.
Then, the solvent was distilled off by using an

evaporator. This operation was repeated 3 times. The collected polymer was dried under reduced pressure to prepare 0.30 g of a polymer. The structure of the resultant polymer was determined through analysis according to ^1H -NMR (FT-NMR: Bruker DPX 400; resonance frequency: 400 MHz; measured nuclear species: ^1H ; solvent used: DMSO- d_6 ; measurement temperature: room temperature). ^1H -NMR confirmed that the resultant polymer was a polyhydroxyalkanoate containing a unit represented by the following chemical formula (97) as a monomer unit because a peak derived from methyl sulfonate was observed at 3 to 4 ppm.

It was also confirmed that the polyhydroxyalkanoate was a copolymer in which a G unit accounted for 9 mol% of the unit of the polyhydroxyalkanoate represented by the chemical formula (97) and an H unit accounted for 91 mol%

thereof.

In addition, there was no peak observed resulted from sulfonic acid in acid value titration using Potentiometric Titrator AT510 (product of Kyoto Electronics Manufacturing Co., Ltd.) and it was also made evident from this that sulfonic acid was converted to methyl sulfonate. The resultant polymer was evaluated for average molecular weight by means of gel permeation chromatography (GPC; Tosoh Corporation HLC-8120, column; Polymer Laboratories PLgel 5 μ MIXED-C, solvent; DMF/LiBr 0.1% (w/v), polystyrene conversion). As a result, the resultant polymer was found to have a number average molecular weight M_n of 18,600 and a weight average molecular weight M_w of 27,000.

(Example 66)

Esterification reaction of polyhydroxyalkanoate composed of unit represented by chemical formula (84) synthesized in Example 52

0.30 g of the polyhydroxyalkanoate copolymer composed of the unit represented by the chemical formula (84) synthesized in Example 52 (E: 6 mol%, F: 94 mol%) was added to a round-bottomed flask. Then,
5 21.0 ml of chloroform and 7.0 ml of methanol were added to dissolve the polymer, and the solution was cooled to 0°C. 0.64 ml of a 2-mol/L trimethylsilyldiazomethane-hexane solution (manufactured by Aldrich) was added to the solution,
10 and the whole was stirred for 4 hours. After the completion of the reaction, the solvent was distilled off by using an evaporator, and then the polymer was collected.

Furthermore, 21.0 ml of chloroform and 7.0 ml
15 of methanol were added to dissolve the polymer again. Then, the solvent was distilled off by using an evaporator. This operation was repeated 3 times. The collected polymer was dried under reduced pressure to prepare 0.29 g of a polymer. The structure of the
20 resultant polymer was determined through analysis according to ¹H-NMR (FT-NMR: Bruker DPX 400; resonance frequency: 400 MHz; measured nuclear species: ¹H; solvent used: DMSO-d₆; measurement temperature: room temperature). ¹H-NMR confirmed that
25 the resultant polymer was a polyhydroxyalkanoate containing a unit represented by the following chemical formula (98) as a monomer unit because a

peak derived from methyl sulfonate was observed at 3 to 4 ppm.

It was also confirmed that the

5 polyhydroxyalkanoate was a copolymer in which a G unit accounted for 6 mol% of the unit of the polyhydroxyalkanoate represented by the chemical formula (98) and an H unit accounted for 94 mol% thereof. In addition, there was no peak observed

10 resulted from sulfonic acid in acid value titration using Potentiometric Titrator AT510 (product of Kyoto Electronics Manufacturing Co., Ltd.) and it was also made evident from this that sulfonic acid was converted to methyl sulfonate. The resultant polymer

15 was evaluated for average molecular weight in the same manner as in Example 66. As a result, the resultant polymer was found to have a number average molecular weight M_n of 6,800 and a weight average molecular weight M_w of 10,900.

(Example 67)

[Synthesis of polyester using δ -valerolactone]

10.01 g (100.0 mmol) of δ -valerolactone, 4.0 ml
of a solution of 0.1 M of tin octylate(tin 2-
5 ethylhexanoate) in toluene, and 4.0 ml of a solution
of 0.1 M of p-tert-butylbenzyl alcohol in toluene
were placed in a polymerization ampule, and the whole
was dried under reduced pressure for 1 hour and
replaced with nitrogen. After that, the ampule was
10 heat-sealed under reduced pressure and heated to
150°C to perform ring-opening polymerization. 10
hours after that, the reaction was terminated, and
the ampule was cooled. The resultant polymer was
dissolved into chloroform, and reprecipitated in
15 methanol in an amount 10 times that of chloroform
necessary for the dissolution. The precipitate was
collected and dried under reduced pressure to prepare
8.51 g of a polymer. NMR analysis was performed
under the same conditions as those of Example 1 to
20 determine the structure of the resultant polymer.
The analysis confirmed that the polymer was a
polyhydroxyalkanoate containing a unit represented by
the following chemical formula (109) as a monomer
unit.

**B**

(109)

The resultant polyhydroxyalkanoate was evaluated for average molecular weight by means of gel permeation chromatography (GPC; HLC-8220 manufactured by Tosoh Corporation, column; TSK-GEL Super HM-H manufactured by Tosoh Corporation, solvent; chloroform, in terms of polystyrene). As a result, the resultant polyhydroxyalkanoate was found to have a number average molecular weight M_n of 41,000 and a weight average molecular weight M_w of 75,100.

(Example 68)

2.00 g of the polyhydroxyalkanoate composed of the unit represented by the chemical formula (109) synthesized in Example 67 was placed in a round-bottomed flask, and 100 ml of THF was added to dissolve this. The flask was placed under a nitrogen atmosphere, and the solution was stirred at -78°C . Next, 10.0 ml of a solution of 2 M of lithium diisopropylamide in THF were gradually added to the flask, and the whole was stirred at -78°C for 30 minutes. Next, 9.16 g of benzyl bromoacetate were

added to the flask, and the whole was stirred at room temperature for 30 minutes. After the completion of the reaction, the reaction solution was poured into 400 ml of an aqueous solution of ammonium chloride, and 200 ml of dichloromethane was added to extract the organic layer. The extracted organic layer was washed with 100 ml of water 3 times. After the organic layer had been collected, the solvent was distilled off to collect a crude polymer. Next, the polymer was dissolved into 12 ml of THF, then dissolved into THF, and reprecipitated in methanol in an amount 50 times that of THF necessary for the dissolution. The precipitate was collected and dried under reduced pressure to prepare 1.38 g of a polymer. NMR analysis was performed under the same conditions as those of Example 1 to determine the structure of the resultant polymer. The analysis confirmed that the polymer was a polyhydroxyalkanoate containing a unit represented by the following chemical formula (110) as a monomer unit. The analysis also confirmed that an A unit accounted for 10 mol% of the monomer unit and a B unit accounted for 90 mol% thereof.

The resultant polyhydroxyalkanoate was evaluated for average molecular weight by means of gel permeation chromatography (GPC; HLC-8220 manufactured by Tosoh Corporation, column; TSK-GEL Super HM-H manufactured by Tosoh Corporation, solvent; chloroform, polystyrene conversion). As a result, the resultant polyhydroxyalkanoate was found to have a number average molecular weight M_n of 23,200 and a weight average molecular weight M_w of 54,600.

1.00 g of the polyhydroxyalkanoate copolymer represented by the chemical formula (110) synthesized here was dissolved into 100 ml of a mixed solvent of dioxane-ethanol (75 : 25), and 0.22 g of a 5% palladium/carbon catalyst was added to the solution. The inside of the reaction system was filled with hydrogen, and the whole was stirred at room temperature for 1 day. After the completion of the

reaction, in order to remove the catalyst, the
 resultant was filtered through a 0.25- μ m membrane
 filter to collect a reaction solution. After the
 solution had been concentrated, the concentrate was
 5 dissolved into chloroform, and reprecipitated in
 methanol in an amount 10 times that of chloroform.
 The resultant polymer was collected and dried under
 reduced pressure to prepare 0.62 g of a polymer. NMR
 analysis was performed under the same conditions as
 10 those of Example 1 to determine the structure of the
 resultant polymer. The analysis confirmed that the
 polymer was a polyhydroxyalkanoate copolymer
 containing a unit represented by the following
 chemical formula (111) as a monomer unit. The
 15 analysis also confirmed that a C unit accounted for
 10 mol% of the monomer unit and a D unit accounted
 for 90 mol% thereof.

The resultant polyhydroxyalkanoate was
 20 evaluated for average molecular weight by means of
 gel permeation chromatography (GPC; HLC-8220
 manufactured by Tosoh Corporation, column; TSK-GEL

Super HM-H manufactured by Tosoh Corporation,
solvent; chloroform, polystyrene conversion). As a
result, the resultant polyhydroxyalkanoate was found
to have a number average molecular weight Mn of
5 20,100 and a weight average molecular weight Mw of
42,200.

(Example 69)

2.00 g of the polyhydroxyalkanoate composed of
the unit represented by the chemical formula (109)
10 synthesized in Example 67 was placed in a round-
bottomed flask, and 100 ml of THF was added to
dissolve this. The flask was placed under a nitrogen
atmosphere, and the solution was stirred at -78°C.
Next, 10 ml of a solution of 2 M of lithium
15 diisopropylamide in THF was gradually added to the
flask, and the whole was stirred at -78°C for 30
minutes. Next, 8.85 g of 2-acrylamide-2-
methylpropane methyl sulfonate was added to the flask,
and the whole was stirred at room temperature for 30
20 minutes. After the completion of the reaction, the
reaction solution was poured into 400 ml of an
aqueous solution of ammonium chloride, and 200 ml of
dichloromethane was added to extract the organic
layer. The extracted organic layer was washed with
25 100 ml of water 3 times. After the organic layer had
been collected, the solvent was distilled off to
collect a crude polymer. Next, the polymer was

dissolved into 12 ml of THF, then dissolved into THF, and reprecipitated in methanol in an amount 50 times that of THF necessary for the dissolution. The precipitate was collected and dried under reduced pressure to prepare 1.22 g of a polymer. NMR analysis was performed under the same conditions as those of Example 45 to determine the structure of the resultant polymer. The analysis confirmed that the polymer was a polyhydroxyalkanoate containing a unit represented by the following chemical formula (112) as a monomer unit. The analysis also confirmed that an E unit accounted for 7 mol% of the monomer unit and an F unit accounted for 93 mol% thereof.

15 The resultant polyhydroxyalkanoate was evaluated for average molecular weight in the same manner as in Example 45. As a result, the resultant polyhydroxyalkanoate was found to have a number average molecular weight M_n of 25,300 and a weight

average molecular weight Mw of 58,700.

(Example 70)

[Synthesis of polyester using tetrahydro-3-(2-propenyl)-2H-pyrane-2-one and phenyl lactide(3,6-bis(phenylmethyl)-1,4-dioxane-2,5-dione)]

0.28 g (2.0 mmol) of tetrahydro-3-(2-propenyl)-2H-pyrane-2-one represented by the chemical formula (37), 2.96 g (10.0 mmol) of phenyl lactide, 4.8 ml of a solution of 0.01 M of tin octylate(tin 2-ethylhexanoate) in toluene, and 4.8 ml of a solution of 0.01 M of p-tert-butylbenzyl alcohol in toluene was placed in a polymerization ampule. After that, 2.06 g of a polymer was prepared in the same manner as in Example 1. NMR analysis was performed under the same conditions as those of Example 1 to determine the structure of the resultant polymer. The analysis confirmed that the polymer was a polyhydroxyalkanoate copolymer containing a unit represented by the following chemical formula (113) as a monomer unit. The analysis also confirmed that an A unit accounted for 13 mol% of the monomer unit and a B unit accounted for 87 mol% thereof.

The resultant polyhydroxyalkanoate was evaluated for average molecular weight in the same manner as in Example 1. As a result, the resultant polyhydroxyalkanoate was found to have a number average molecular weight M_n of 32,000 and a weight average molecular weight M_w of 56,000.

(Example 71)

Oxidation reaction of polyhydroxyalkanoate composed of unit represented by chemical formula (41) synthesized in Example 70

0.50 g of the polyhydroxyalkanoate copolymer composed of the unit represented by the chemical formula (113) synthesized in Example 71 (A: 13 mol%, B: 87 mol%) was placed in a round-bottomed flask, and 30 ml of acetone was added to dissolve this. The

flask was placed in an ice bath, 5 ml of acetic acid and 0.35 g of 18-crown-6-ether were added, and the whole was stirred. Next, 0.28 g of potassium permanganate was gradually added to the flask in the ice bath, and the whole was stirred in the ice bath for 2 hours and stirred at room temperature for an additional 18 hours. After the completion of the reaction, 0.45 g of a polymer was prepared in the same manner as in Example 23. NMR analysis was performed under the same conditions as those of Example 1 to determine the structure of the resultant polymer. The analysis confirmed that the polymer was a polyhydroxyalkanoate containing a unit represented by the following chemical formula (114) as a monomer unit.

The resultant polyhydroxyalkanoate was evaluated for average molecular weight in the same manner as in Example 1. As a result, the resultant polyhydroxyalkanoate was found to have a number average molecular weight M_n of 30,100 and a weight average molecular weight M_w of 54,200.

Furthermore, in order to calculate the unit of the resultant polyhydroxyalkanoate, 29 mg of the polyhydroxyalkanoate prepared in the same manner as in Example 24 were subjected to NMR analysis in the same manner as in Example 1. The analysis confirmed that the polyhydroxyalkanoate was a copolymer in which a C unit accounted for 12 mol% of the unit of the polyhydroxyalkanoate represented by the chemical formula (114) and a D unit accounted for 88 mol% thereof.

(Example 72)

Condensation reaction between polyhydroxyalkanoate composed of unit represented by chemical formula (114) synthesized in Example 71 and 4-methoxyaniline-2-sulfonic acid

Under a nitrogen atmosphere, 0.40 g of the polymer synthesized by using the polyhydroxyalkanoate copolymer composed of the unit represented by the chemical formula (114) synthesized in Example 71 (C: 12 mol%, D: 88 mol%) and 0.33 g of 4-methoxyaniline-2-sulfonic acid were placed in a 100-ml three-necked

flask. 15.0 ml of pyridine was added to the flask, and the mixture was stirred. After that, 0.84 ml of triphenyl phosphite was added, and the whole was heated at 120°C for 6 hours. After the completion of the reaction, 0.33 g of a polymer was prepared in the same manner as in Example 45. The structure of the resultant polymer was determined through analysis in the same manner as in Example 45. As a result of IR measurement, a peak at 1,695 cm^{-1} derived from a carboxylic acid reduced, and a peak derived from an amide group was newly observed at 1,658 cm^{-1} . $^1\text{H-NMR}$ confirmed that the resultant polymer was a polyhydroxyalkanoate containing a unit represented by the following chemical formula (115) as a monomer unit because a peak derived from an aromatic ring of the 4-methoxyaniline-2-sulfonic acid structure shifted.

It was also confirmed that the

polyhydroxyalkanoate was a copolymer in which an E unit accounted for 11 mol% of the unit of the polyhydroxyalkanoate represented by the chemical formula (115) and an F unit accounted for 89 mol% thereof. The resultant polymer was evaluated for average molecular weight in the same manner as in Example 45. As a result, the resultant polymer was found to have a number average molecular weight M_n of 29,500 and a weight average molecular weight M_w of 53,700.

INDUSTRIAL APPLICABILITY

According to the present invention, there can be provided: a novel polyhydroxyalkanoate containing, in a molecule, a vinyl group as a reaction active group at a side chain thereof; a novel polyhydroxyalkanoate containing a carboxyl group in a molecule; a novel polyhydroxyalkanoate containing, in a molecule, a unit having an amide group and a sulfonic group; and a method of producing such a polyhydroxyalkanoate. A novel polyhydroxyalkanoate having a vinyl group or a carboxyl group can find applications in functional materials because it can introduce a functional group which provides functionalities by using its reaction active group. Furthermore, a polyhydroxyalkanoate containing, in a molecule, a unit having a carboxyl group, an amide

group, or a sulfonic group is expected to find use in applications including medical soft members because it is excellent in melt processability, and is excellent in biocompatibility by virtue of its

5 hydrophilicity.

This application claims priority from Japanese Patent Application No. 2004-174783 filed June 11,

10 2004, which is hereby incorporated by reference herein.
